Global competition for economic migration

Visa menus, worker histories and the allocation of talent

The economic question

Governments offer access, costs and rights

Admission is one part of a package that shapes a person's future options

Access to employment

- Occupation, citizenship and sponsorship can determine which routes a worker can use.
- Employer portability changes the jobs available **after admission**.
- A route opening can redirect workers from another destination rather than create a new move.

Residence and membership

- Family work rights, renewal and settlement change the value of the initial offer.
- Argentina's investment-linked **citizenship** initiative illustrates a different membership instrument—not a work visa.
- Announced terms, binding rules and operational access are distinct.

How do these offers change the allocation of workers—and the offers made by rival governments?

▶ Legal examples ▶ Nationality-specific routes

How do governments respond to workers and rivals?

Worker substitution connects visa menus to competition for talent

Government offers → worker choices and composition → rival offers

- **Worker side:** which terms affect participation, destination, employer choice and retention?
- **Government side:** do countries compete through fees, eligibility and rights?
- **Firm side:** how do recruitment, sponsorship and employer dependence affect wages and allocation?

Which allocation and welfare consequences follow from a change in one country's offer?

> Measure menus and careers first. Estimate worker substitution, then add the decision problem of firms or governments.

Connecting legal offers with global career allocation

Route-level policy bundles connect policy measurement with worker histories

- **Policy measurement and competition:** legal regimes select different migrants and compete for talent (Helbling et al. 2017; de Haas et al. 2018; Czaika and Parsons 2017; Shachar 2006).
  → **Our contribution:** a broad motive inventory and dated, work-oriented route bundles for comparable profiles.
- **International allocation:** alternatives, return migration and international careers matter (Bertoli and Fernández-Huertas Moraga 2013; Brinatti and Guo 2024; Amanzadeh et al. 2024; Bhalothia et al. 2025).
  → **Our contribution:** connect legal menus to domestic and international career transitions.
- **Legal options and labour markets:** access to migrant labour, employer restrictions and connected domestic markets shape firm and worker outcomes (Doran et al. 2022; Townsend and Allan 2025; Borusyak et al. 2026).
  → **Our contribution:** cross-country legal-menu measurement, with competing government offers as a proposed extension.

▶ Full literature map ▶ Demand identification ▶ Government objectives

Data: offers and histories

One Atlas, two layers: inventory and characteristics

The retained delivery distinguishes migration motives from detailed contract terms

Broad pathway inventory

5,744 country/name entries · 194 destination labels

Work, study, family, protection, business/investment, visit and other categories.

Search-window metadata: **2000–2025**.

This is a retained inventory, not certified exhaustive legal discovery.

Detailed annual characteristics

2,195 country/route IDs · 43,049 route-years

80 value fields + 80 status fields, with four identifying columns.

Work-oriented selection precedes detailed extraction. Native unit: **destination × route × year**.

Eligibility · financial burdens · procedures · employment rights · family rights · renewal and settlement

▶ Categories and fields ▶ Identity and history

Revelio follows domestic and international job histories

Foundation totals and transition samples are distinct constructions

Full keyed foundation	Broad verified-geography events, 2010–2025
549.7 million keyed people	**892.2 million** domestic transitions
1.766 billion positions	**83.65 million** international transitions

One person can contribute several different events

Domestic employer change → international job-country change → return or onward transition

- These are **career events**, not counts of visa grants or necessarily residential moves.
- The strict whole-history sample retains **303.5 million people**; its denominator differs from the broad sample above.

▶ Sample and chronology ▶ Gaps and attrition ▶ Horizon outcomes

Matching policies to careers requires comparable profiles

Legal eligibility and observed career characteristics are not the same object

Dimension	Atlas and policy comparison	Revelio and analytical support
Time	2000–2025 presentation window	Verified transition comparison: 2010–2025
Occupation	22 nonmilitary SOC major groups	Finer O*NET codes retained; SOC major groups used here
Origin	Citizenship/residence conditions	Prior recorded job country—not citizenship
Education	Route-specific requirements	Lifetime highest degree need not precede a move

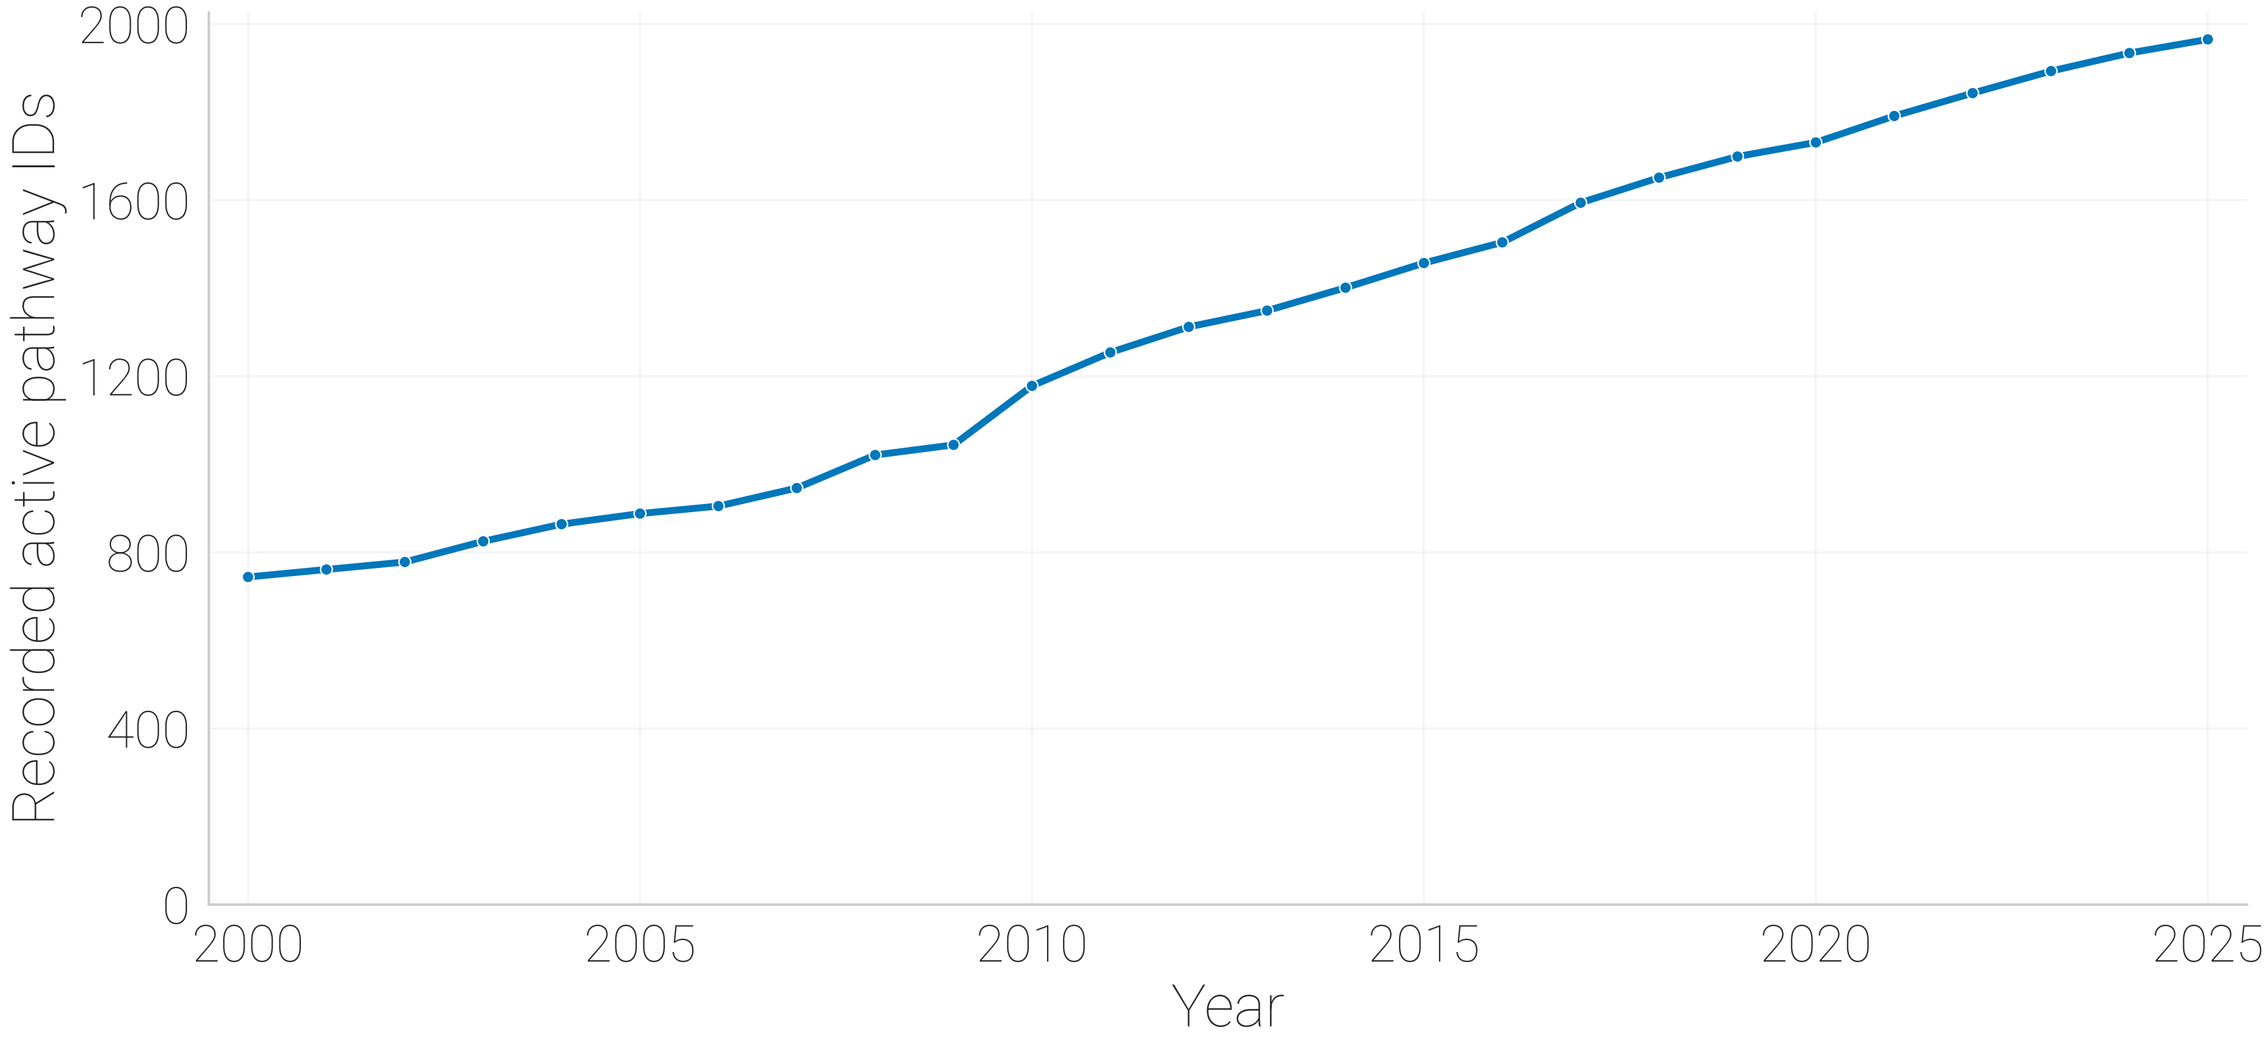

Passing occupation and education screens is **partial compatibility**, not complete admission eligibility.

▶ All occupational levels ▶ Coverage ▶ Unresolved rules

Three descriptive facts

Recorded active pathways increase over time

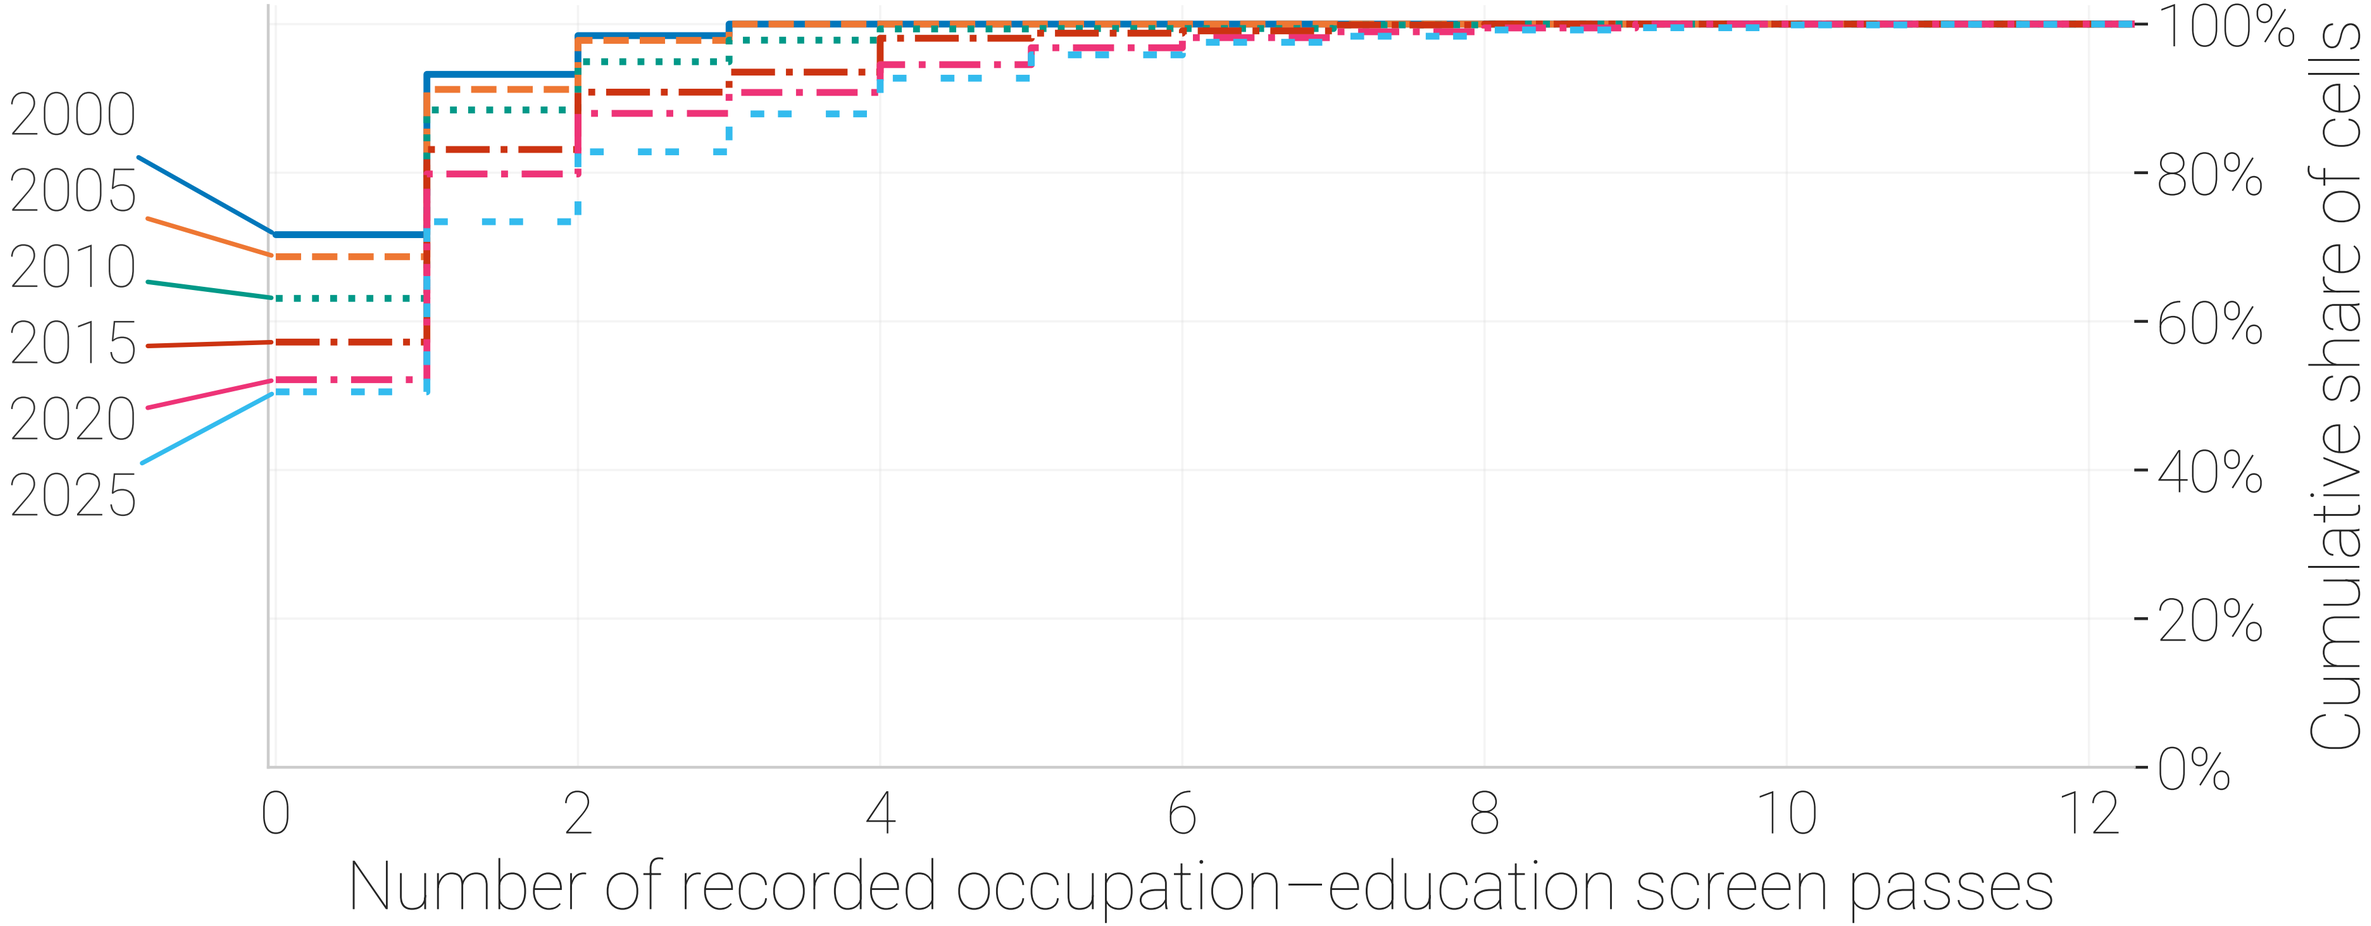

Work-oriented route IDs · 2000–2025 · 744 → 1,965

▶ Country representation ▶ Appearances and endings

Recorded screen passes increase on fixed support

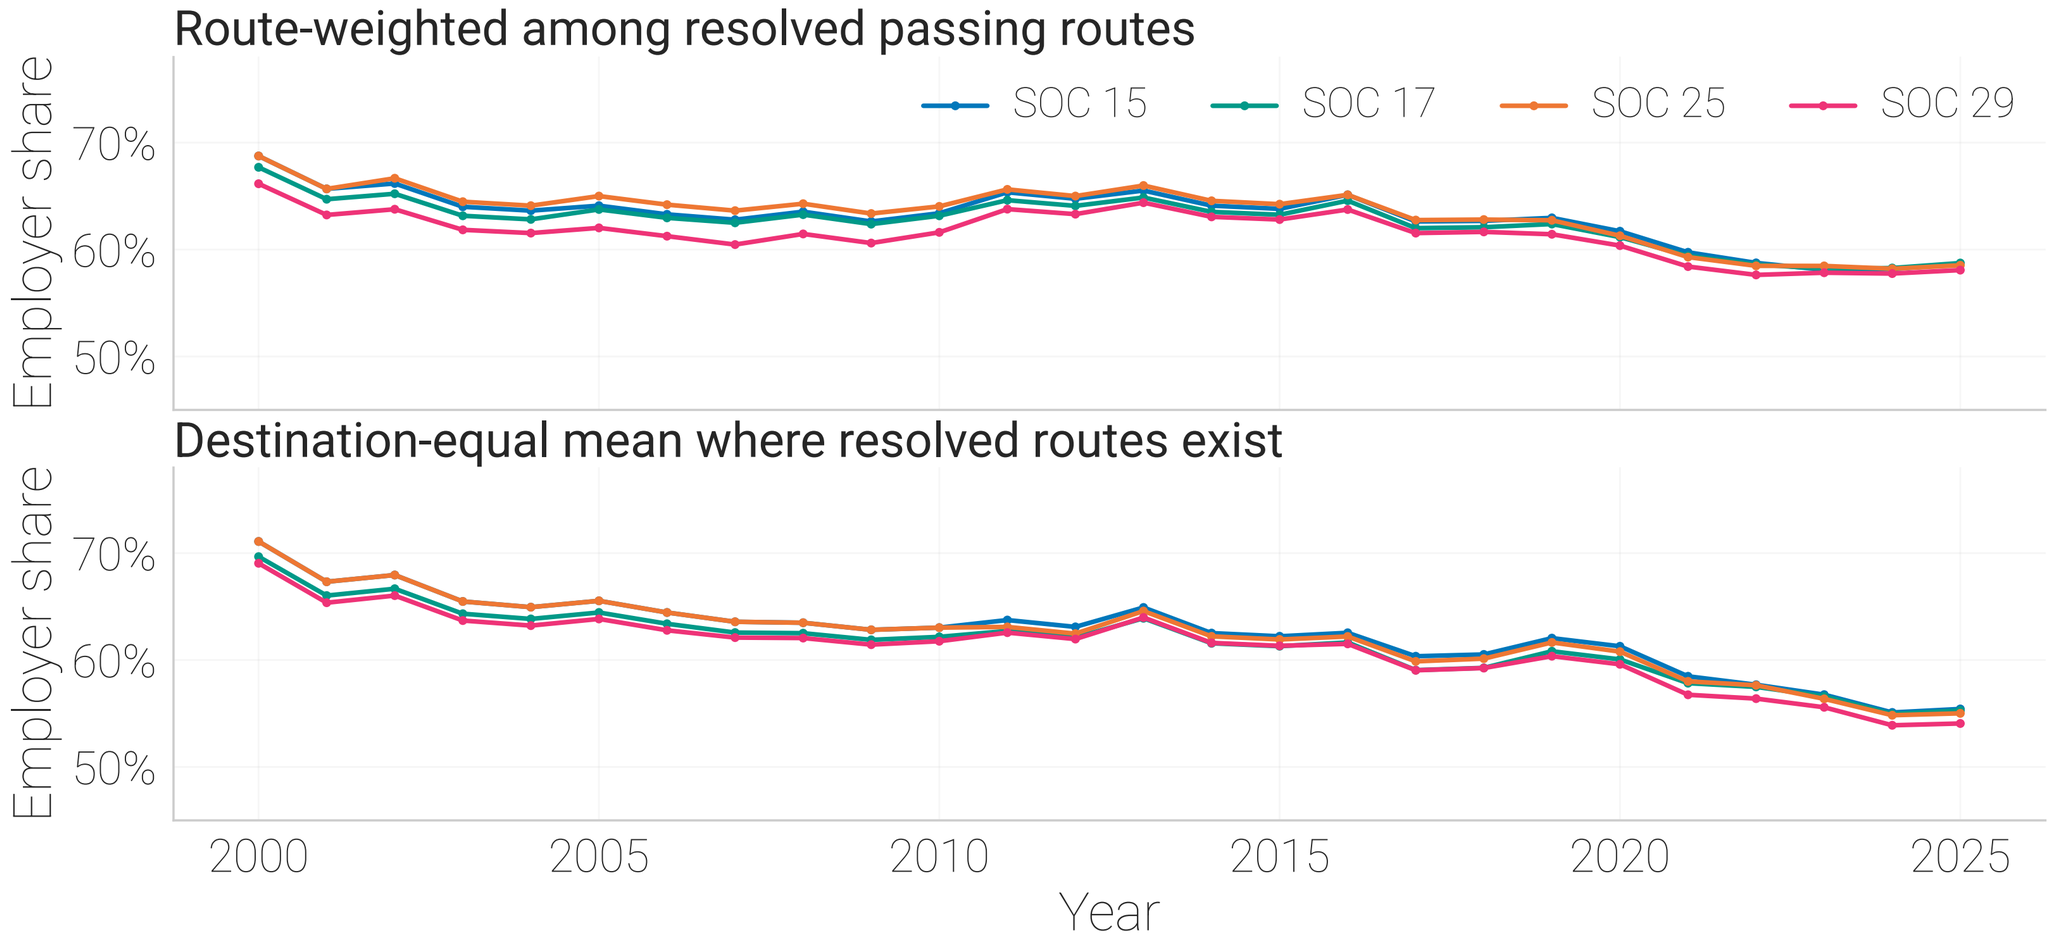

Fixed destination–profile support · equal cell weights · six dates

▶ Changing support ▶ Computer/math example ▶ Healthcare example

Employer sponsorship remains common as its recorded share falls

2000–2025 · four occupation profiles · undergraduate screen · resolved sponsorship

▶ Weights ▶ Education rules ▶ Family rights ▶ Fee contrasts

A profile can face different joint requirement bundles

Czechia, 2024 · SOC 15 undergraduate screen · three of 12 passing route IDs

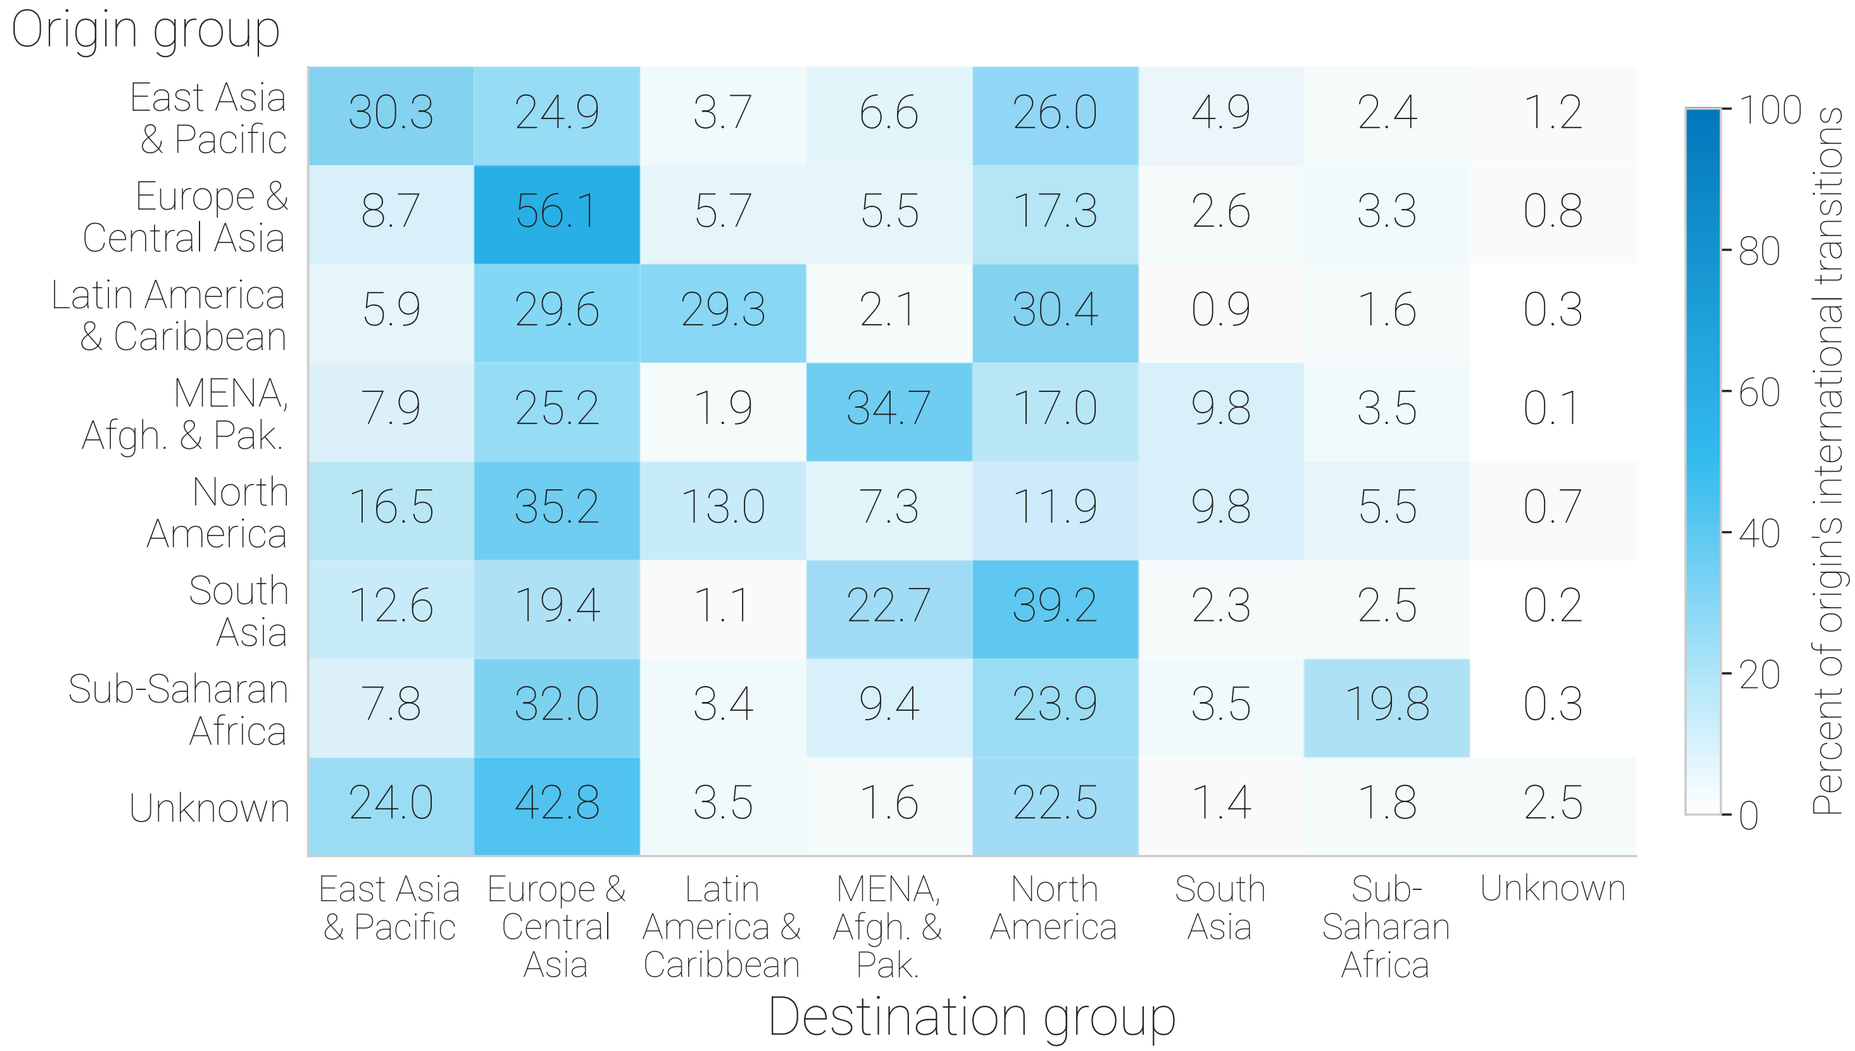

Recorded route	Sponsor	Applicant fee	Annual salary floor	Nationality condition
Digital Nomad Visa	None	CZK 2,500	CZK 780,144	AU, CA, GB, JP, KR, NZ, TW, US
Employee Card	Employer	CZK 7,500	CZK 226,800	No recorded gate
EU Blue Card	Employer	CZK 5,000	CZK 780,138	Unknown

- Each row is an **actual recorded package**, not independent field minima.
- Occupation/education compatibility is not complete eligibility for one person.
- Nationality, admission risk and continuation rights prevent an unqualified dominance claim.

▶ Dominance test ▶ Preferential routes

International transitions between regions

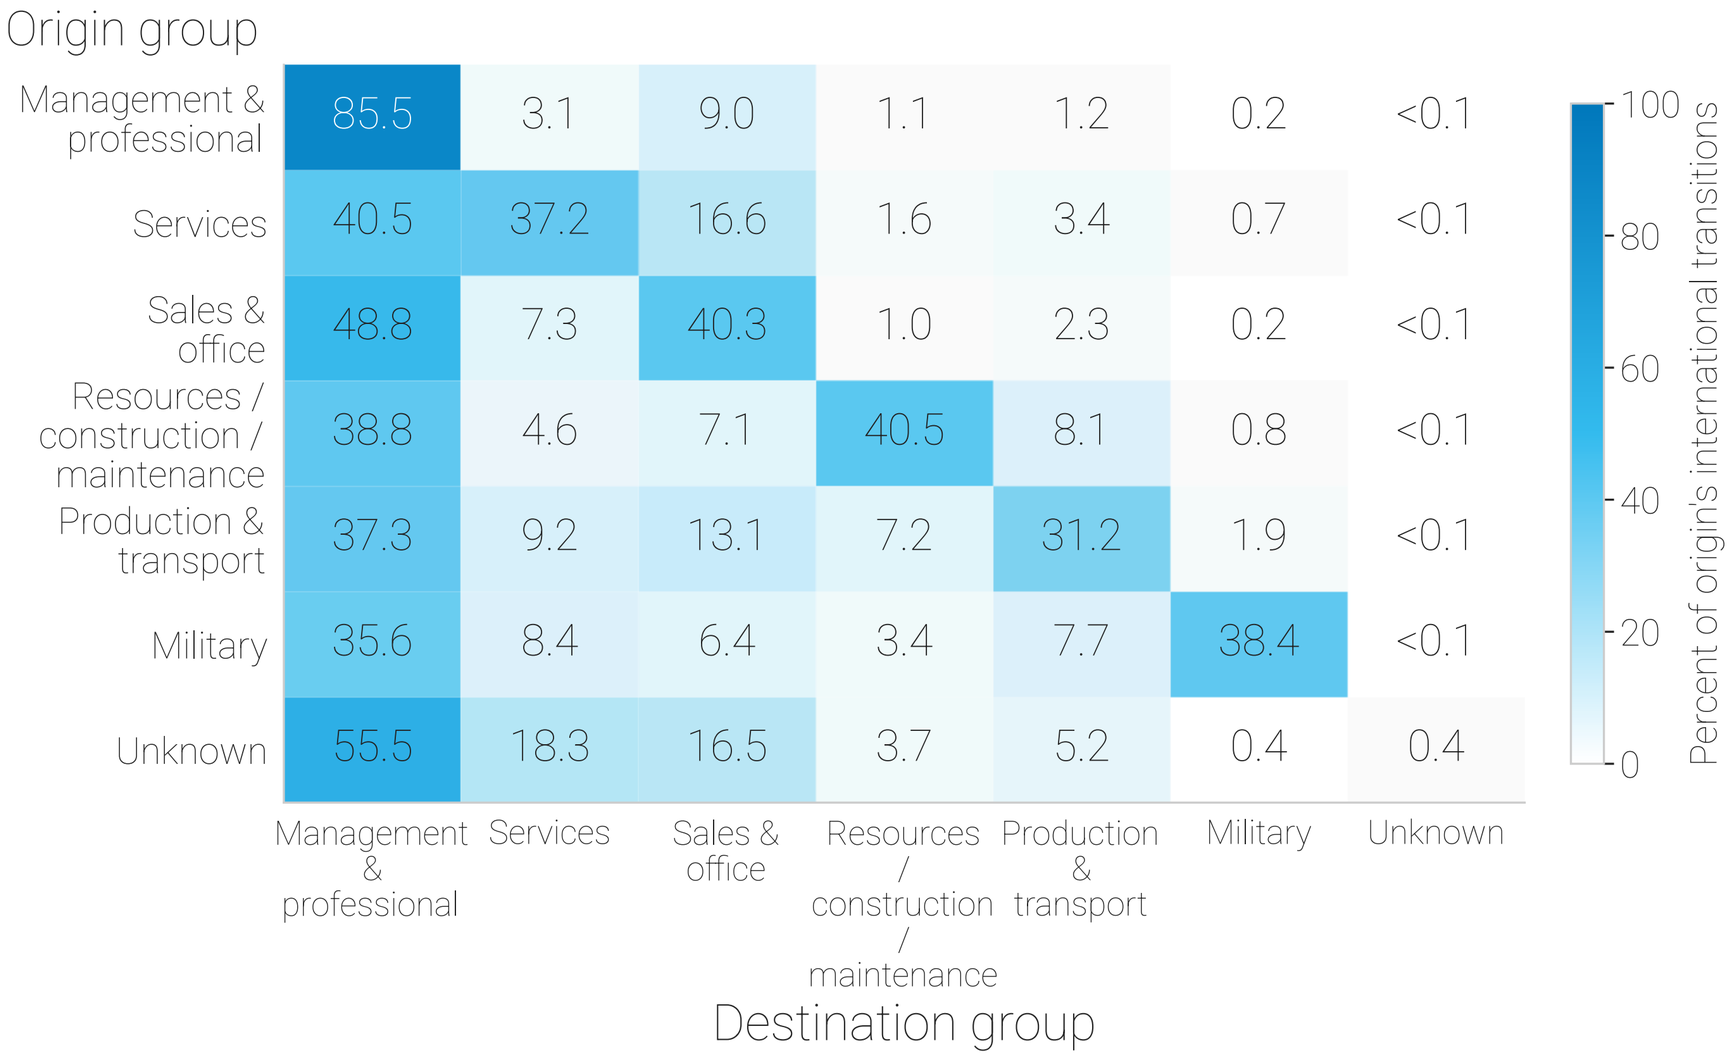

Broad verified-country events · 2010–2025 · diagonal: different countries in the same region

▶ Region counts ▶ Income-group transitions ▶ Income counts

International transitions between occupational families

Strict-history international events · 2010–2025 · occupational families, not a skill ladder

▶ Family counts ▶ All 23 SOC groups ▶ Domestic comparison ▶ Skill/task interpretation

Worker responses and policy incentives

Workers choose among the pathways they can access

A random-utility model separates fixed geography from government-chosen offers

$$u_{ijt} = \alpha \log \widetilde{w}_{ijt} + \underbrace{\beta' z_{od}}_{\text{fixed geography}} + \underbrace{\gamma' q_{jt}}_{\text{chosen visa terms}} + \xi_{jt} + \varepsilon_{ijt}, \qquad j = (d, v).$$

$$p_{ijt}(C_{it}) = \frac{\mathbf{1}\{j \in C_{it}(r_t)\} \exp(V_{ijt})}{\sum_{k \in C_{it}(r_t)} \exp(V_{ikt})}.$$

- **Net wage** $\widetilde{w}$: earnings net of taxes and annualised application charges.
- z: distance and other fixed geography; q: rights and portability; r: eligibility rules.
- $C_{it}(r_t)$ includes staying and the worker's accessible pathways.

Migration RUMs and destination substitution: (Kennan and Walker 2011; Bertoli and Fernández-Huertas Moraga 2013).

▶ Denominators and MPML ▶ Fixed effects ▶ Preference versus access

Estimation must separate preferences from access

Gravity connects individual choices to flows; zeros alone do not reveal why an option is absent

$$\mu_{odt} = N_{ot} \sum_{v} \mathbb{E}[p_{i,dv,t}(C_{it}) \mid o, t].$$

Two endogenous margins: $\widetilde{w}_{ijt}$ and q_{jt} may covary with ξ_{jt}; the accessible set C_{it} is partly unobserved.

- **Offers:** demand inversion and instruments (Berry and Haile 2024).
- **Access:** latent or restricted choice sets (Agarwal and Somaini 2026; Almagro and Sood 2026).
- **Information:** revealed-preference bounds (Porcher et al. 2025).

▶ Fixed effects and samples ▶ Monetary comparability ▶ Government costs

Demand elasticities connect design, costs and welfare

The same demand estimates can discipline a firm model or a government model

$$D(a;\hat{\eta}), \qquad \max_{a_d} \; R_d(a, D) + B_d(D) - C_d(a_d, D), \qquad a_d = (f_d, q_d, r_d).$$

- **Demand + supply conditions** → restrictions on marginal costs and incentives.
- **New design:** a portable work visa replaces employer-tied permission.
- **Counterfactuals:** who applies, how firms and rivals respond, and who gains?

Demand elasticities are the common input; objectives and equilibrium determine the welfare exercise.

▶ Government cost inversion ▶ Welfare scope ▶ All references

Appendix: legal objects and data

Admission, residence and citizenship are distinct

Example	Institutional distinction	Presentation scope
Argentina investment-linked citizenship	2025 decrees create category/procedure; October 2026 announcement describes financial/family terms.	Citizenship, not a work visa. Exact operational opening not established.
Citizenship-conditioned work access	A potential migrant's nationality can determine a preferential route.	Previous job country cannot assign nationality.
Employer-tied work permission	Admission may leave the holder dependent on a sponsor.	Portability and continuation can matter without an immediate move.

The US H-1B1 comparison and Germany's Western Balkans employment regulation provide source-backed nationality examples; they are not a verified identification of the separately mentioned recent German occupation-specific announcement.

▶ Return: motivation

A nationality preference need not dominate a general route

- H-1B1 for Chile/Singapore has nationality-specific allocations and a distinct visa-abroad procedure.
- Temporary-intent and duration/renewal terms differ from the ordinary H-1B framework.
- Germany’s Western Balkans route illustrates nationality-conditioned access with different qualification rules.

Compare the whole bundle for the same applicant and date: eligibility, sponsor, fees, intent, work rights and continuation.

▶ Return: motivation ▶ Return: route bundles

The broad inventory includes more than work routes

Retained category code	Entries
Work	1,480
Study	446
Family	571
Protection	576
Business/investment	579
Visit	669
Other	1,423
Total	**5,744**

Characteristic families

- Access and selection
- Fees, funds, salary and investment
- Procedures and compliance
- Work rights and portability
- Family and dependent rights
- Duration, renewal and settlement
- Identity, status and timing

The detailed release has **80 values and 80 status companions**, not 80 independent screening instruments. A separate AI-category field is blank in 3,693 inventory entries.

▶ Return: Atlas

Route identity and annual history require validation

- ID: country plus supplied/slugified route name—not an adjudicated legal equivalence class.
- Annual states use lifecycle bounds, recorded changes and forward-filling; they are not independent annual legal observations.
- Renaming, branching and succession can change counts without adding a simultaneous option.
- Unknown, inapplicable, uncertain and known values must remain distinct.

Raw annual years: 1940–2026; intended search/display window: 2000–2025. The UK has only two IDs in the unchanged 2024 retained panel, a consequential coverage warning.

▶ Return: Atlas ▶ Return: growth

Occupational detail and analytical restrictions differ

Level or selection	Count/scope	Interpretation
Official SOC major/minor/broad/detailed	23 / 98 / 459 / 867	Reference taxonomy, not observed vendor counts
Atlas major-group scenarios	22	Military excluded; national classifications mapped into SOC
Earlier skilled-group analysis	11	Analytical restriction
Current monetary gravity	15, 17, 25, 29	Four selected major groups
Retained Revelio source	O*NET code; older `role_k1500` fallback	Fine counts, complete vendor hierarchy and edition unverified

The observed occupation source includes military and malformed values. Exact recognized-code rules differ from simply taking two initial characters.

▶ Return: bridge ▶ Return: occupations

History construction changes the retained population

Object	People	Positions/events
Full keyed foundation	549,729,026	1,765,970,337 positions
Strict whole histories	303,499,990	1,117,773,296 positions
Strict adjacent events, all retained years	—	814,273,306 events
Broad verified geography, 2010–2025	—	975,853,764 events

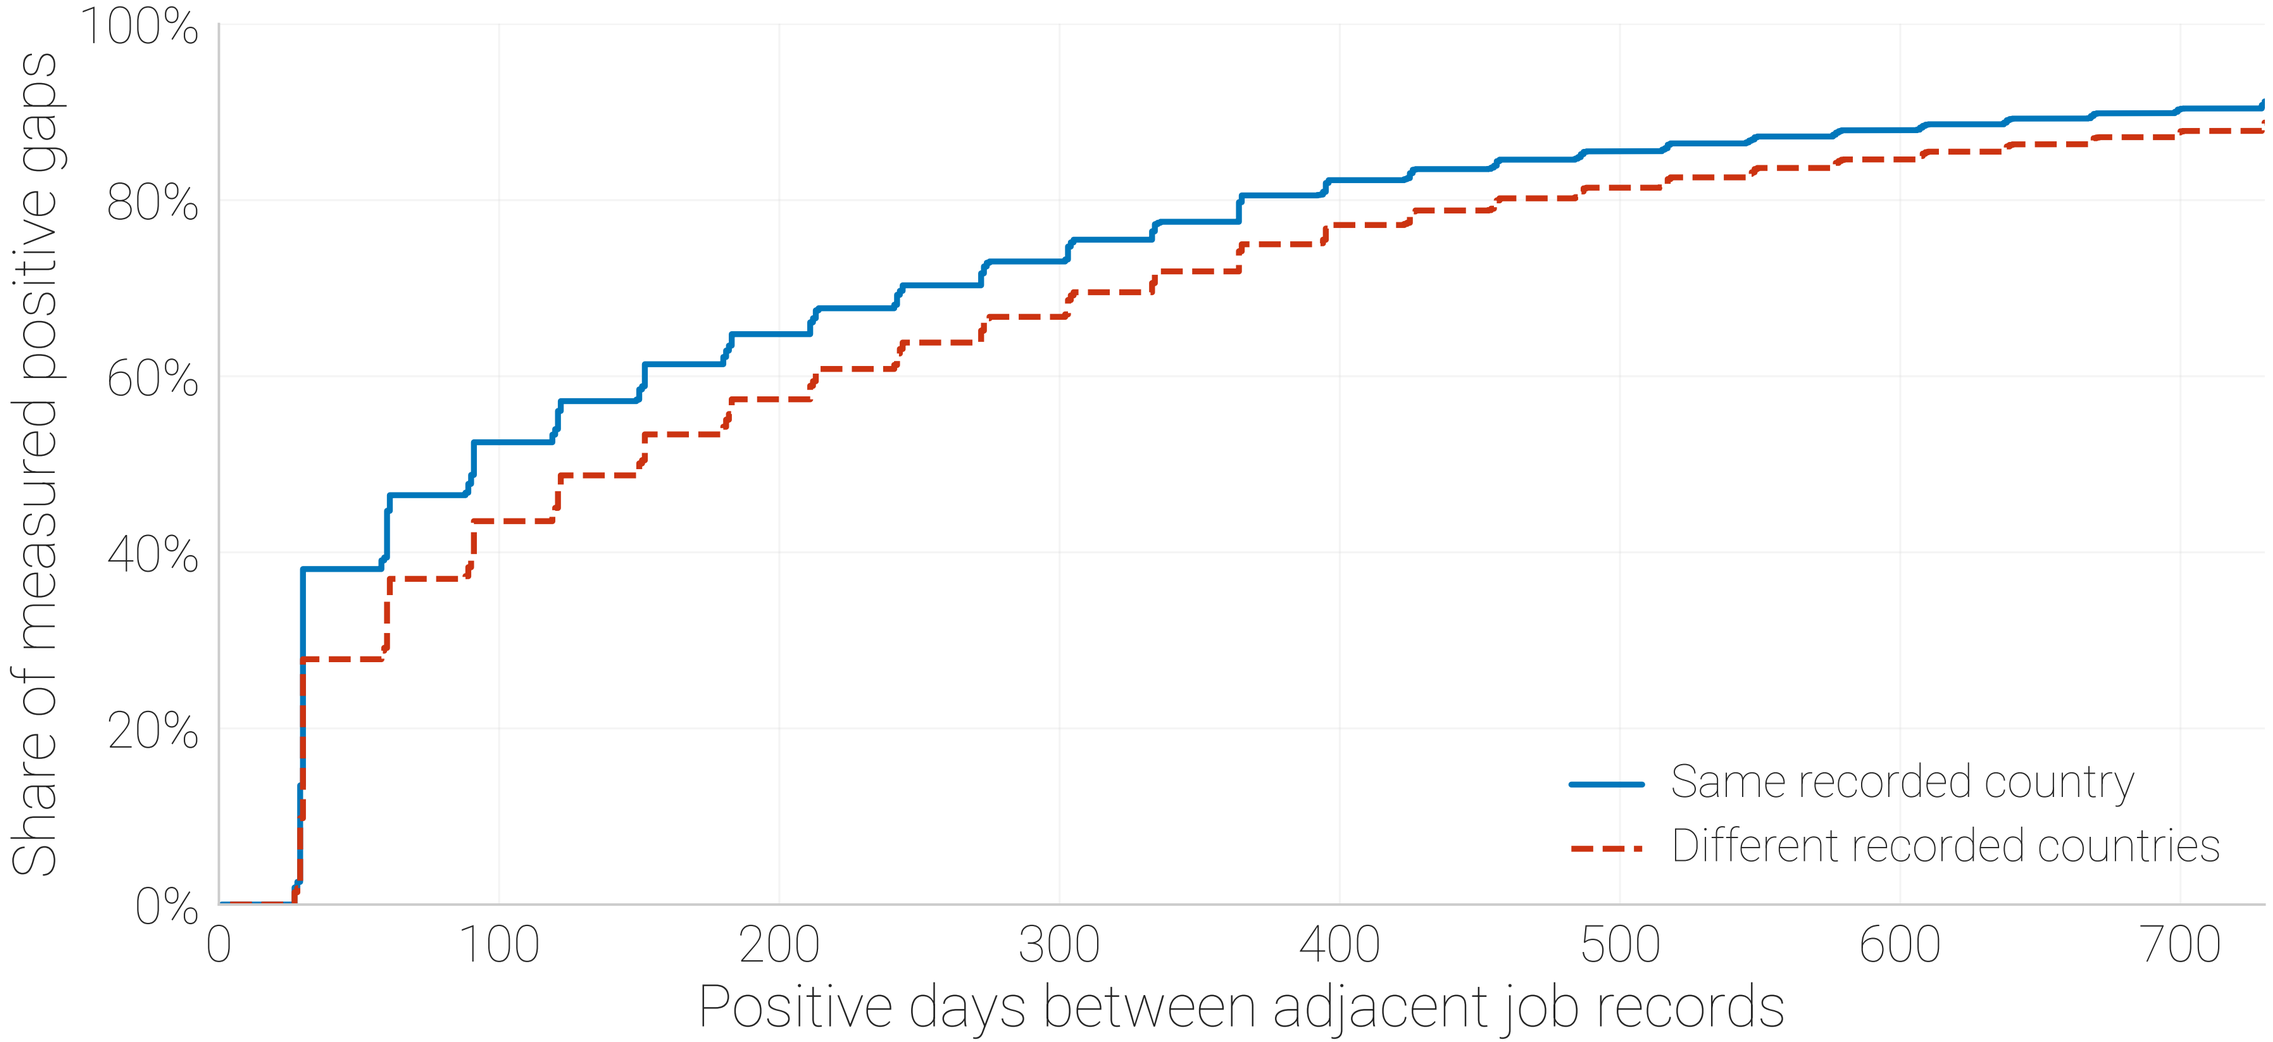

Missing starts, countries and tied starts have **overlapping** exclusion counts. The strict rule excludes a person if any history record fails; the broad geography construction removes missing-country records before ordering.

These are different populations, not successive rows in one funnel. Concurrent positions, missing ends and chronology cannot be resolved by arbitrary sorting.

▶ Return: histories

Many positive gaps are short; missing updates still matter

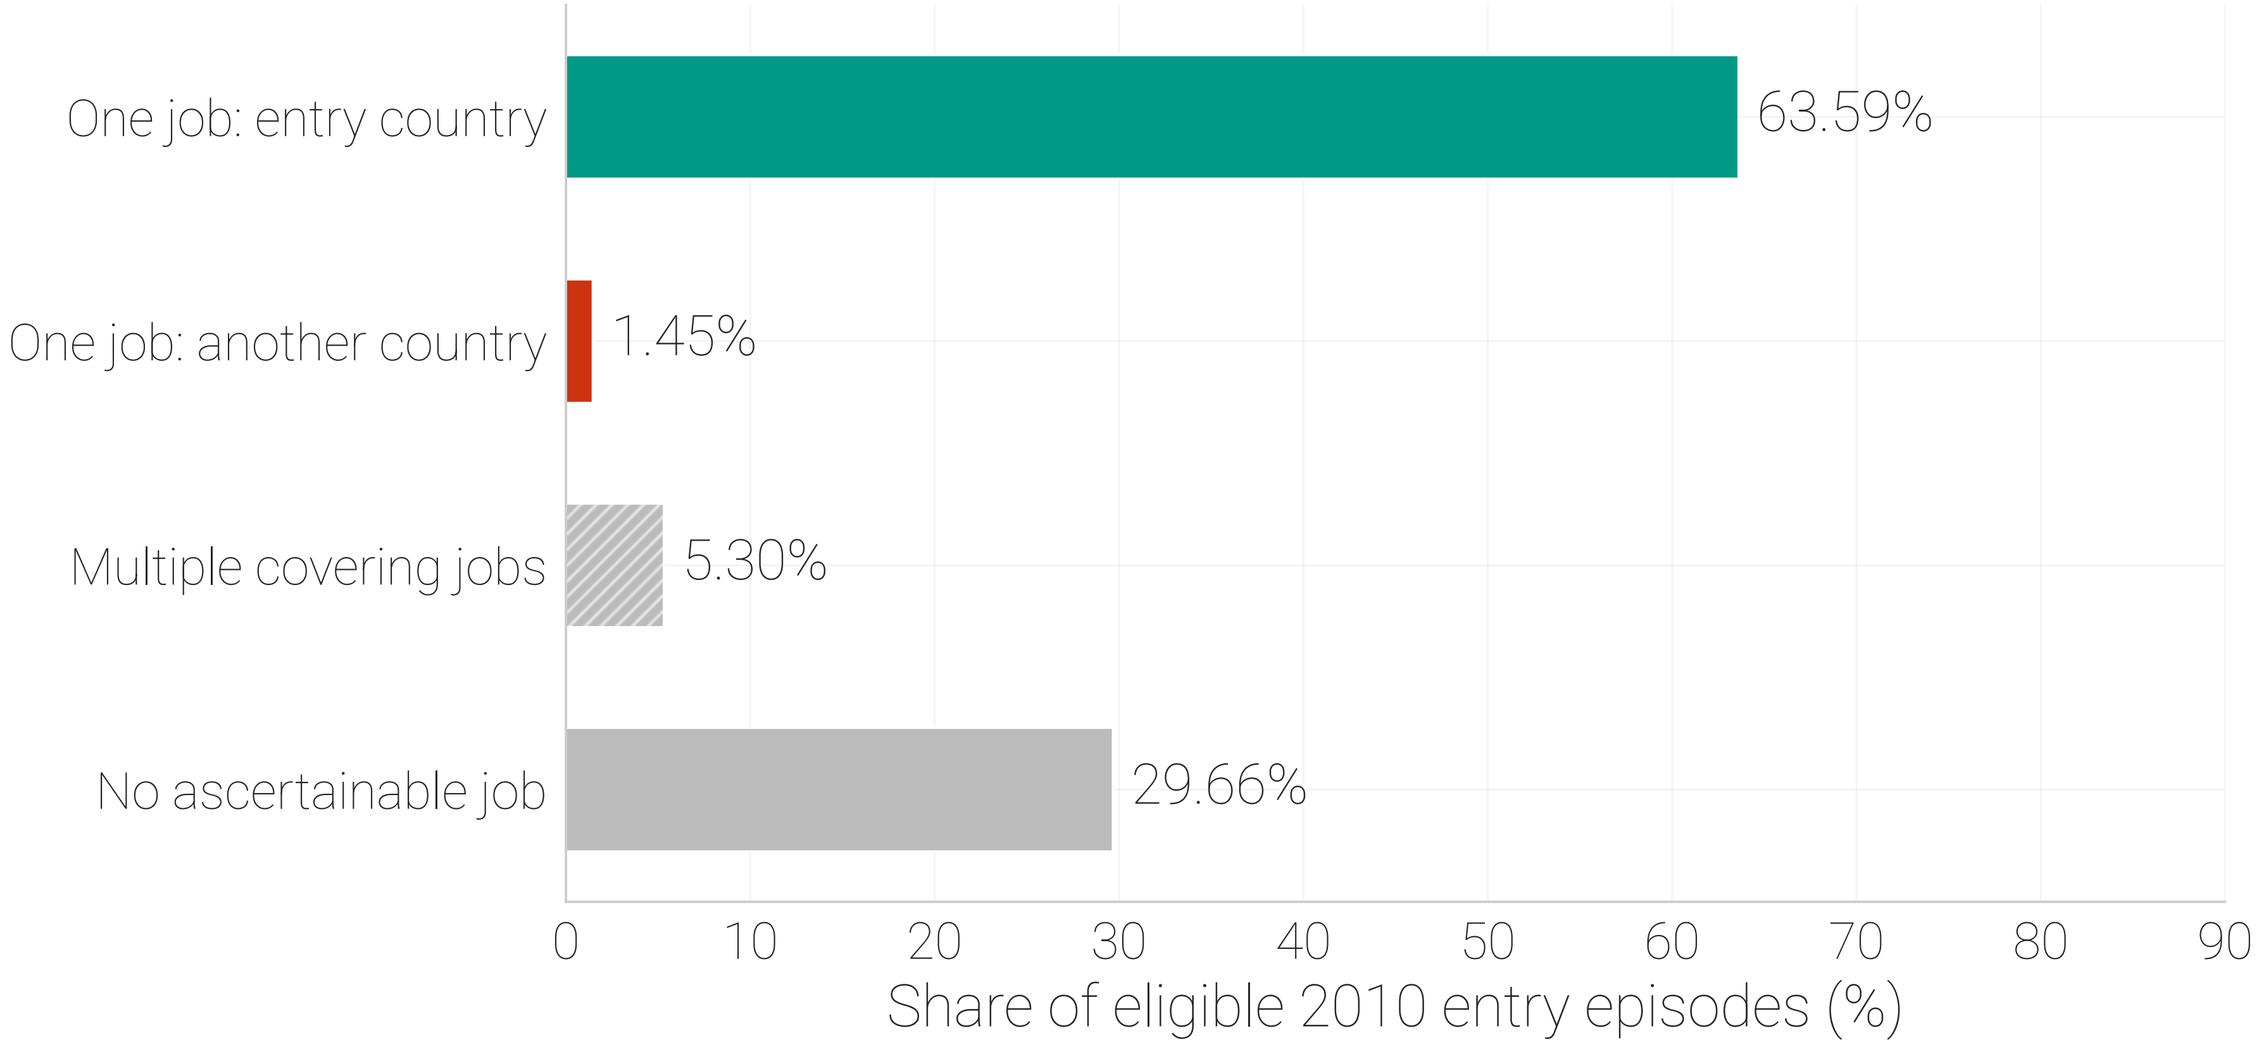

Measured positive adjacent-record gaps · not unemployment or legal-status gaps

▶ Return: histories

A fixed horizon requires a job covering the endpoint

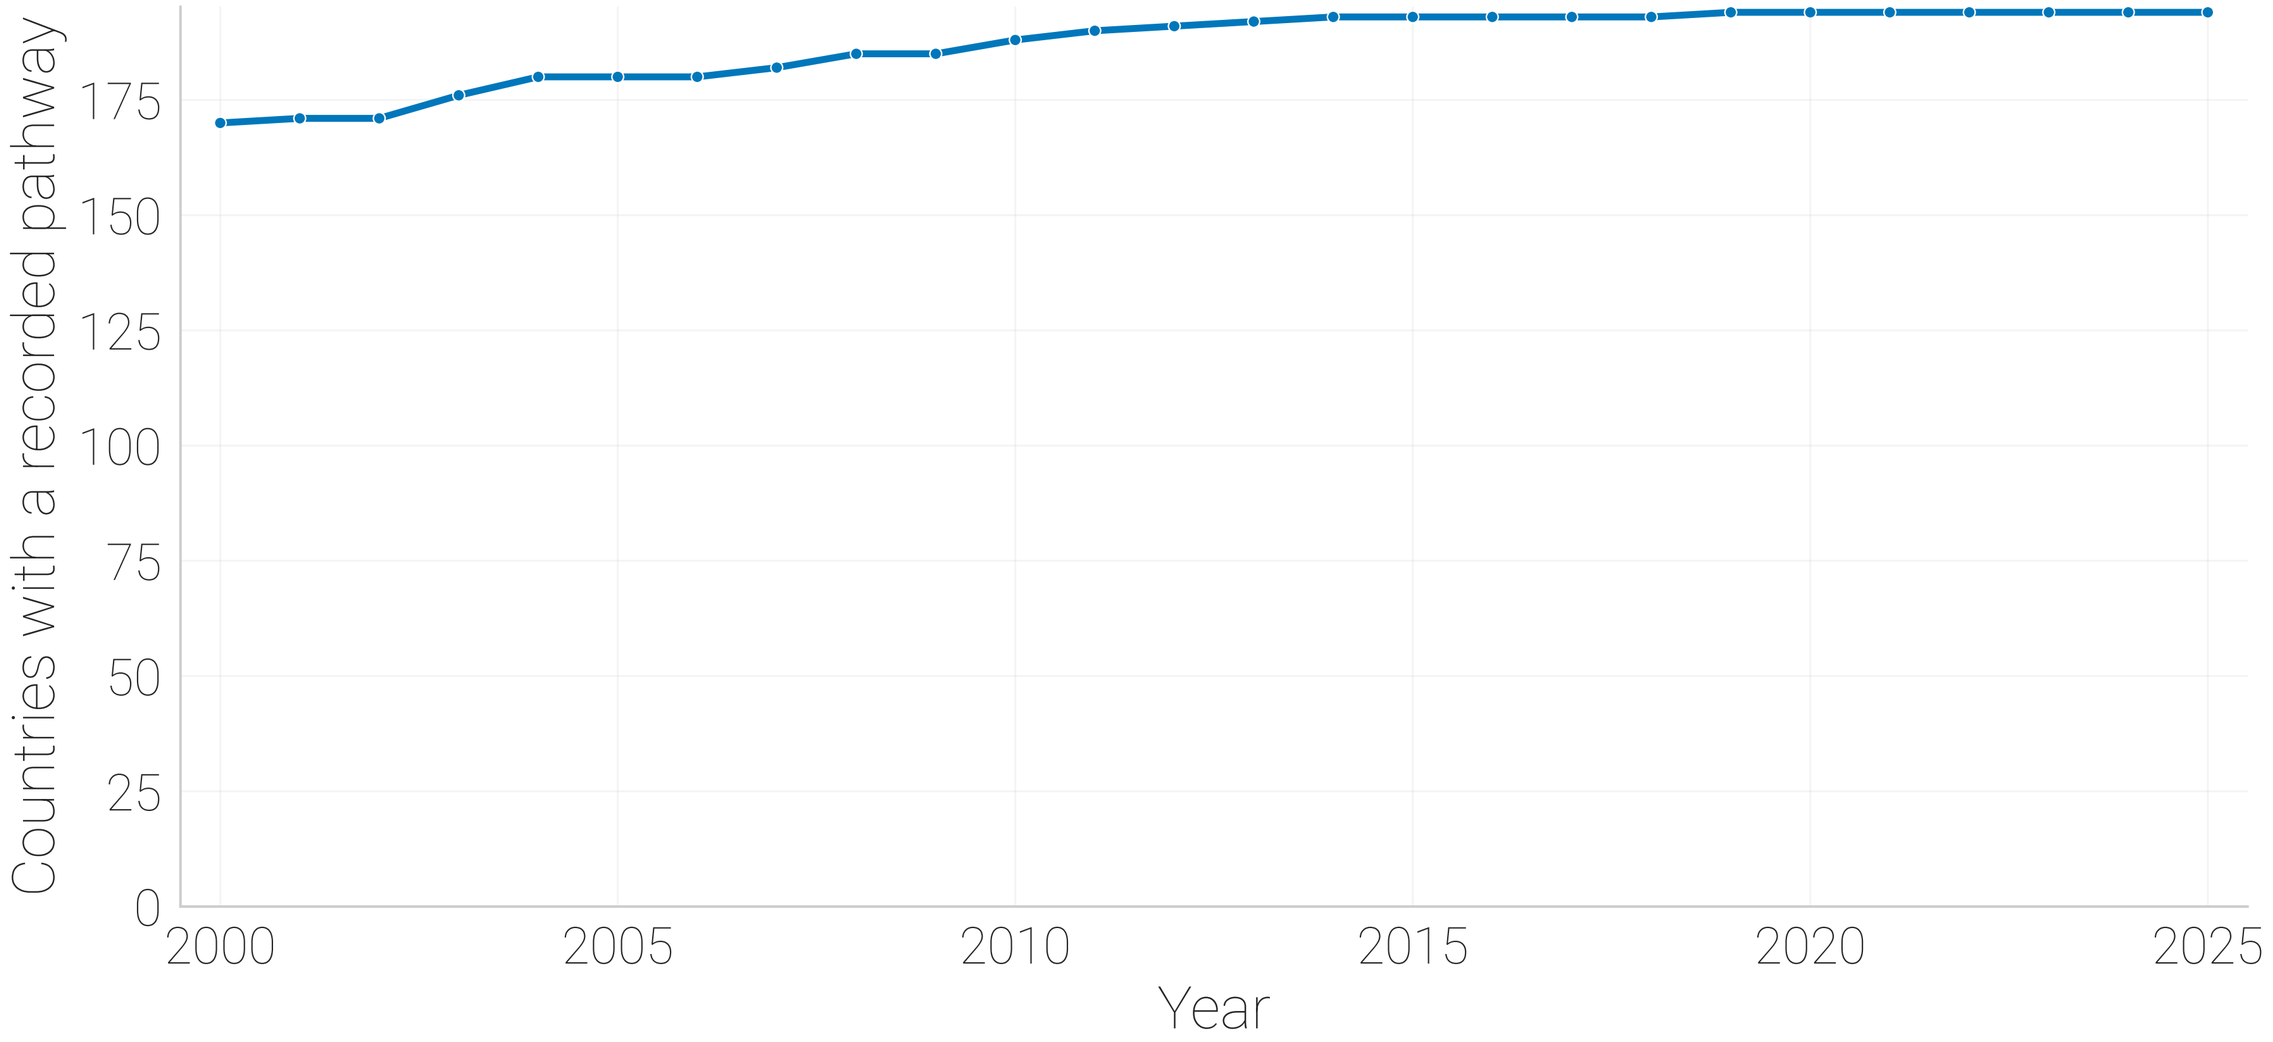

Corrected one-year endpoint comparison · unresolved follow-up is separate

▶ Return: histories

Historical representation broadens over time

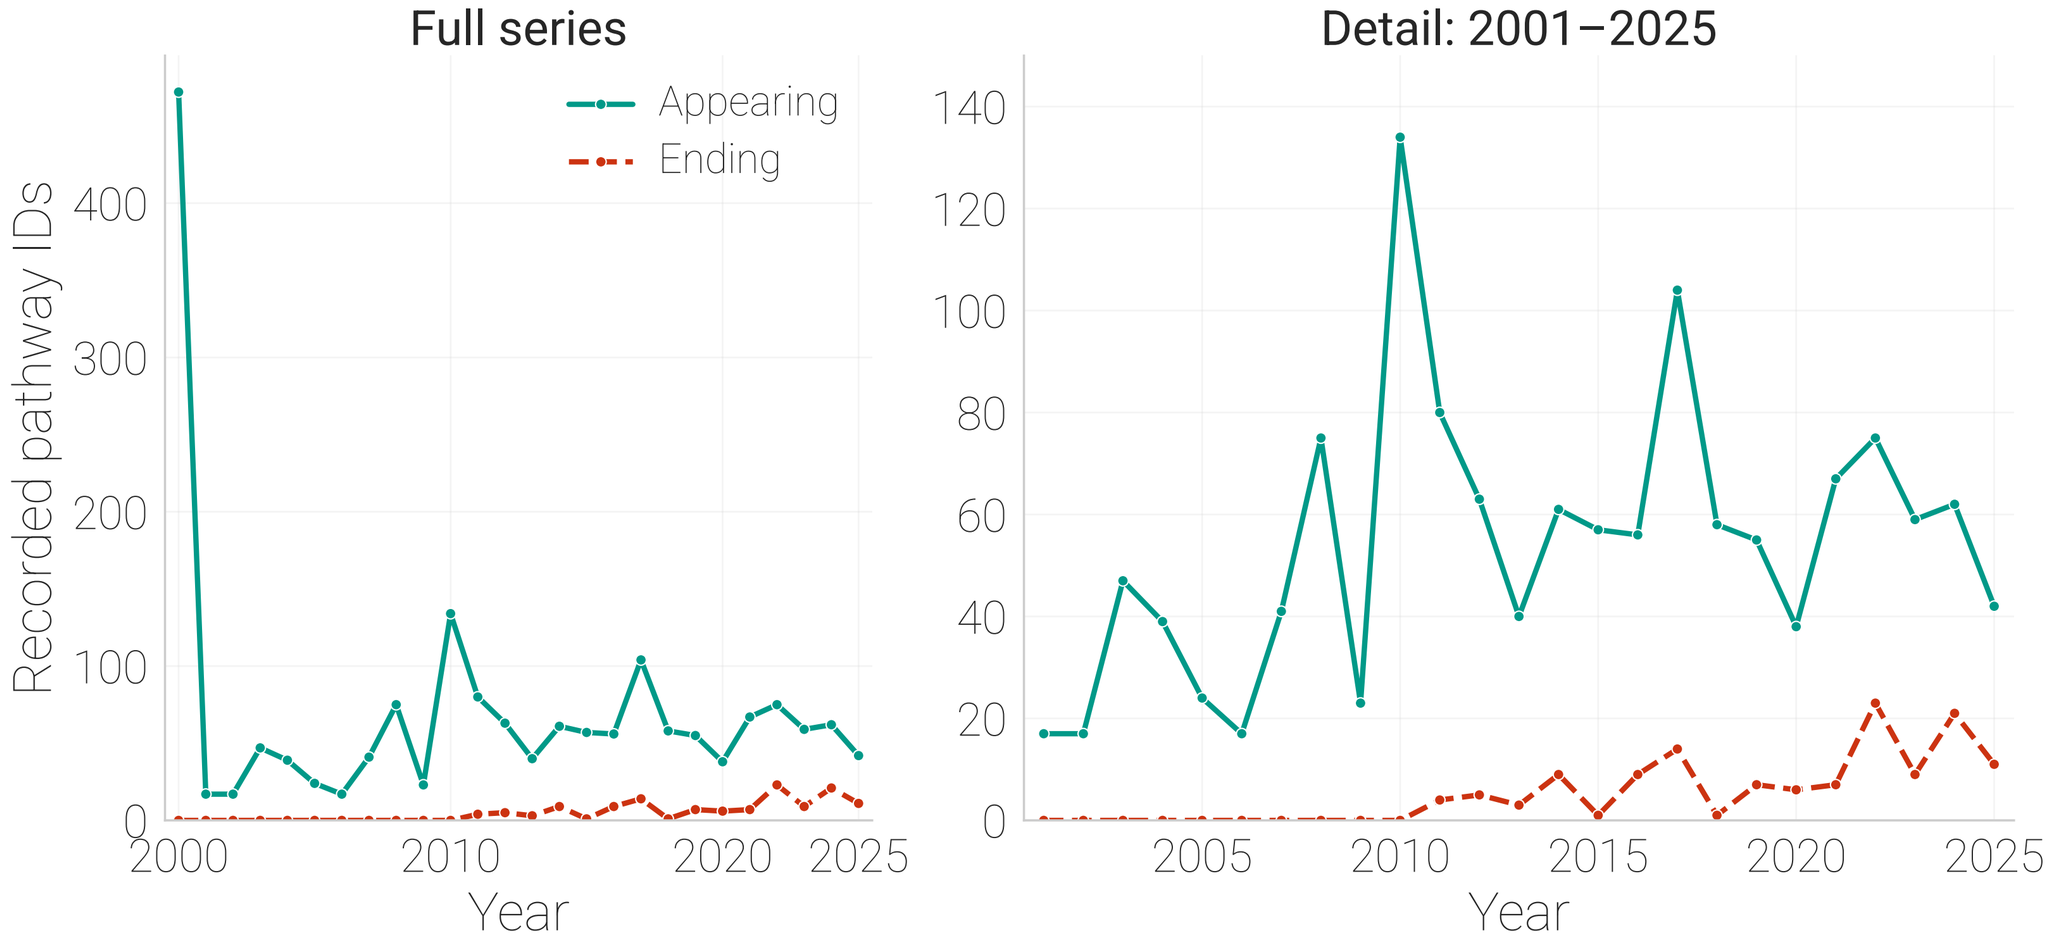

Represented destination labels · not necessarily new policy adopters

▶ Return: growth ▶ Return: bridge

Recorded appearances and endings are not legal births and deaths

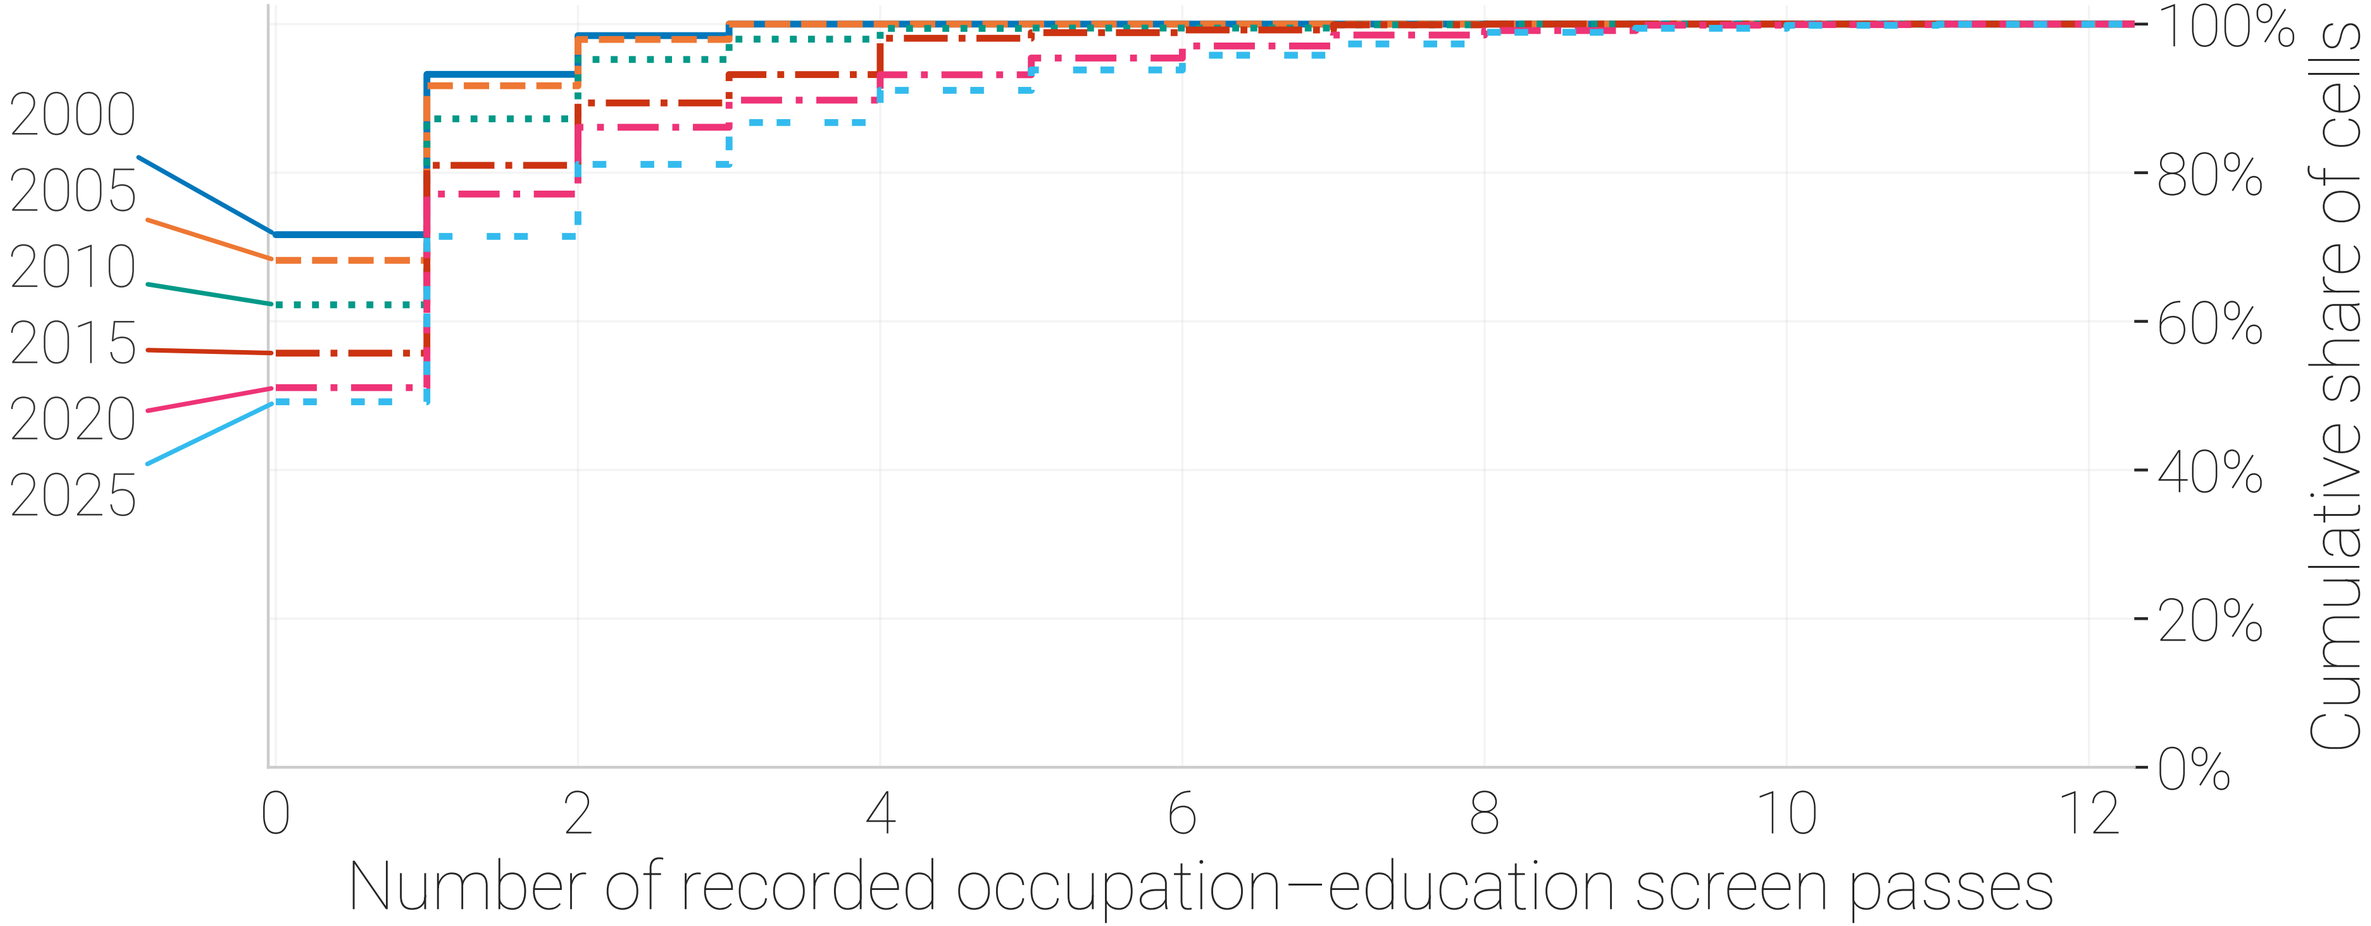

The 2000 boundary and unresolved status affect lifecycle interpretation

▶ Return: growth

Changing support gives a different pooled comparison

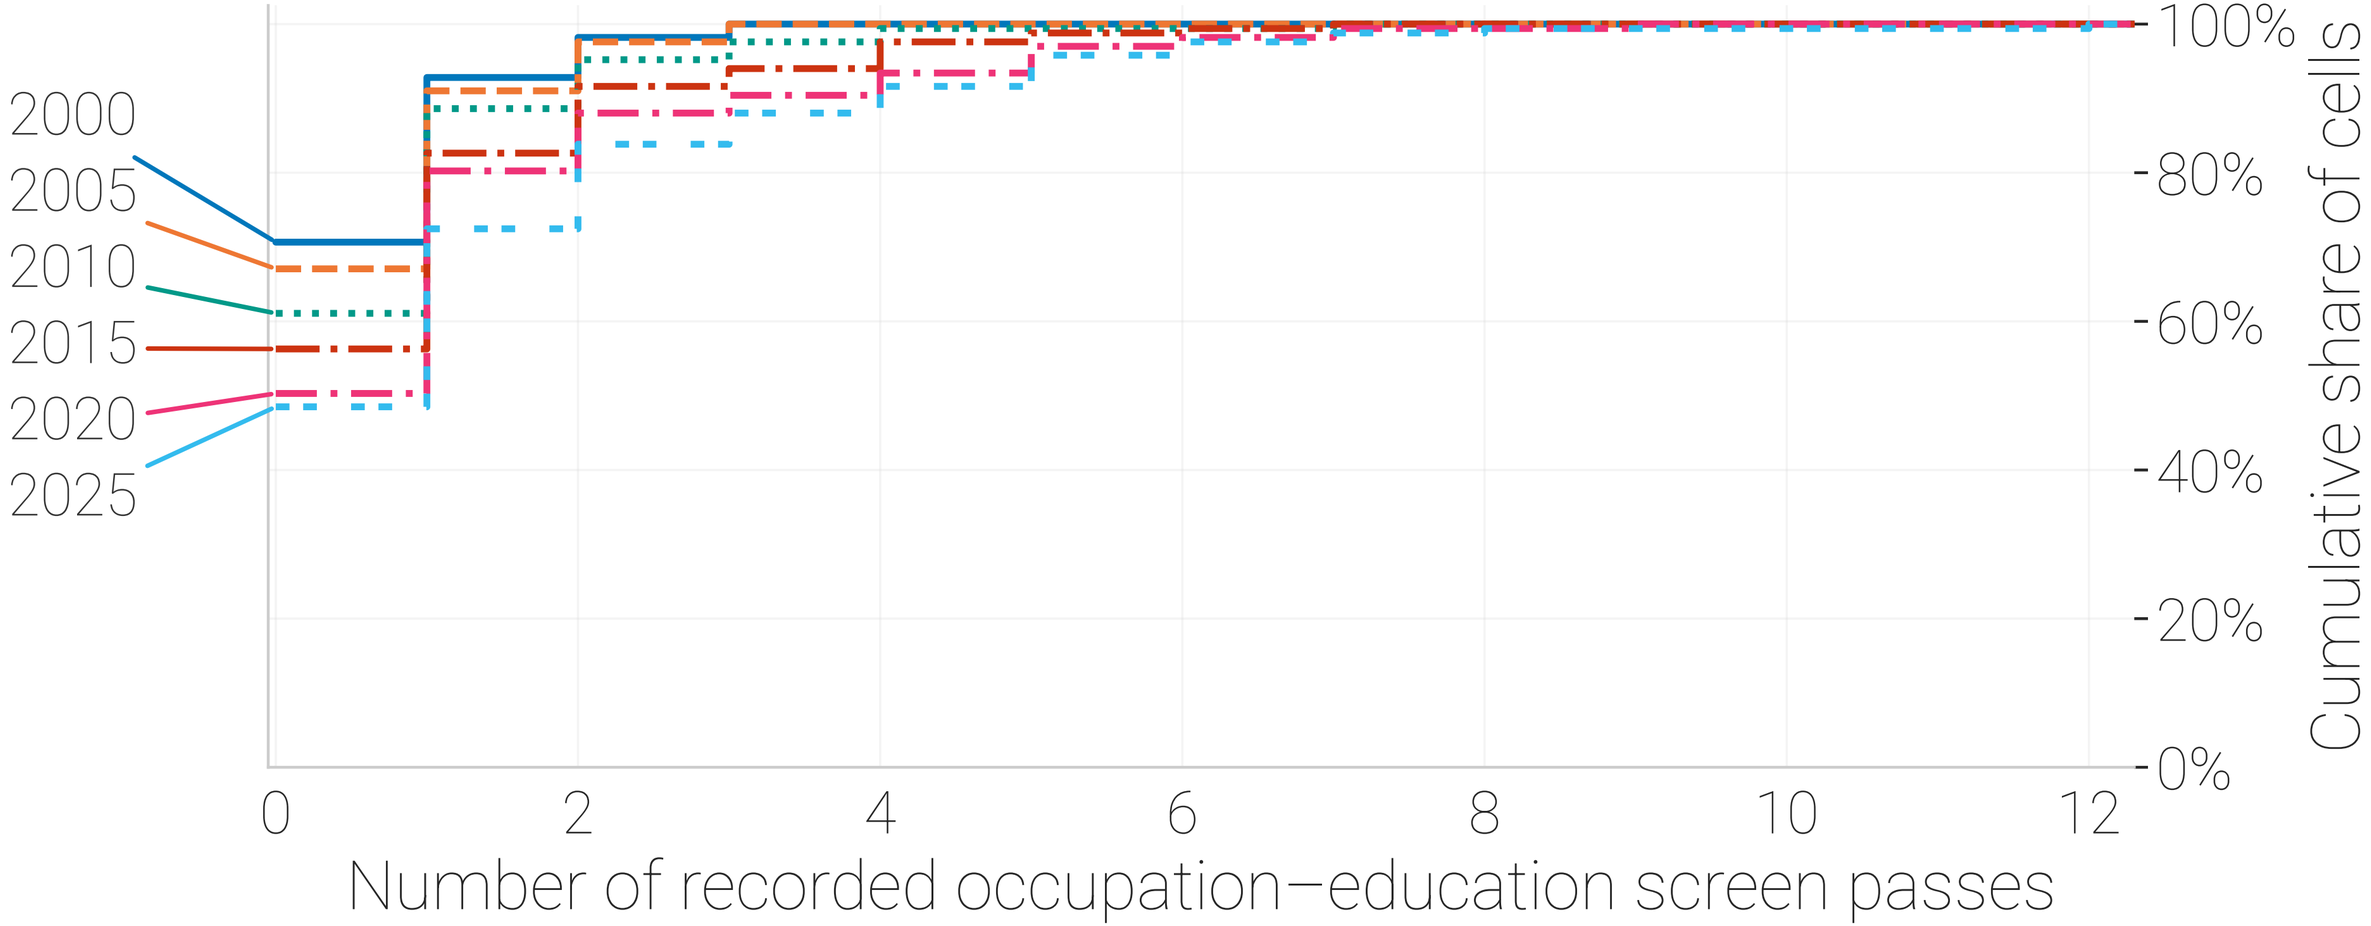

Changing destination support · occupation–education scenarios · six dates

▶ Return: fixed-support result

Computer/mathematical profile: fixed-support comparison

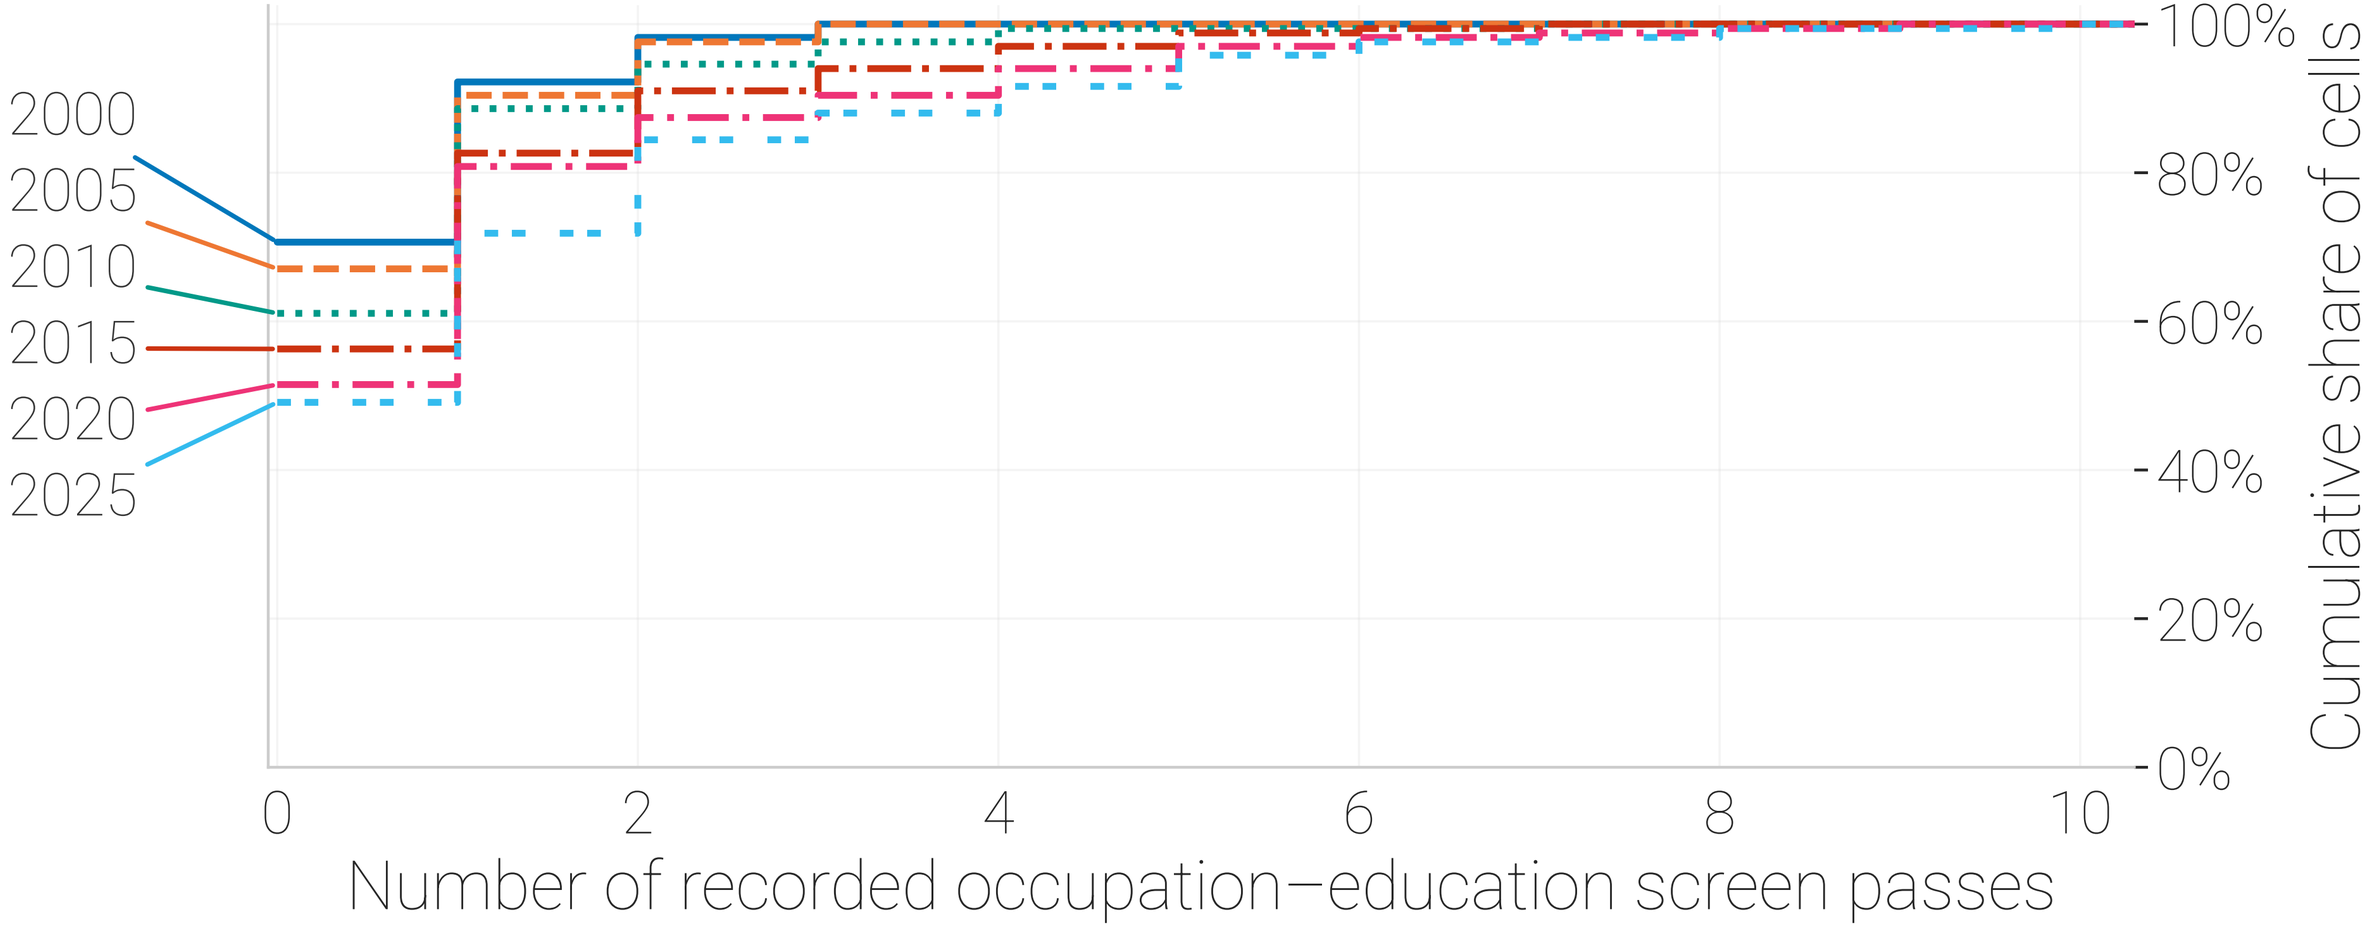

SOC 15 · undergraduate screen · six dates · no nationality or age screen

▶ Return: pooled profiles

Healthcare-practitioner profile: fixed-support comparison

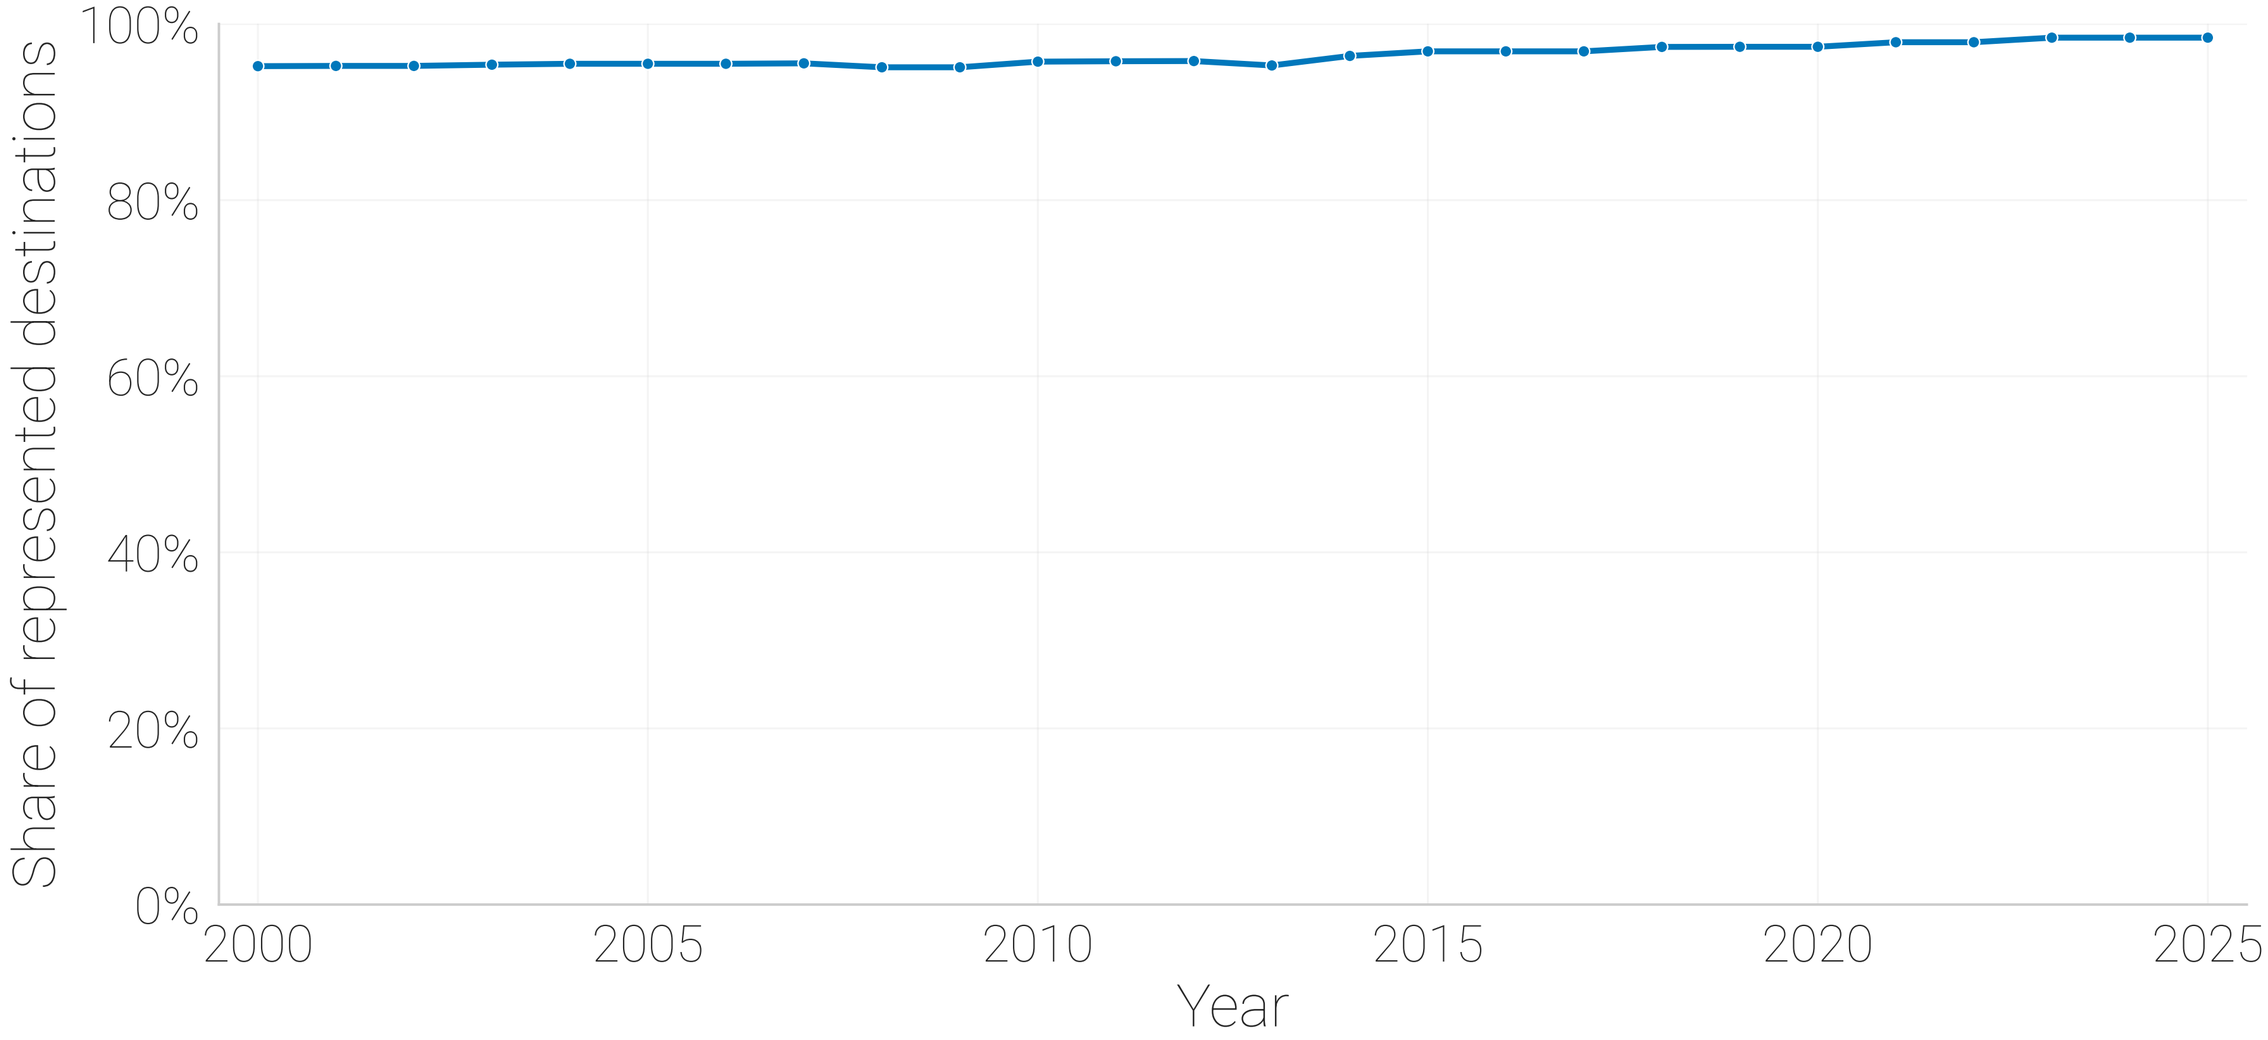

SOC 29 · undergraduate screen · six dates · no nationality or age screen

▶ Return: pooled profiles

Unresolved rules prevent a complete legal-menu interpretation

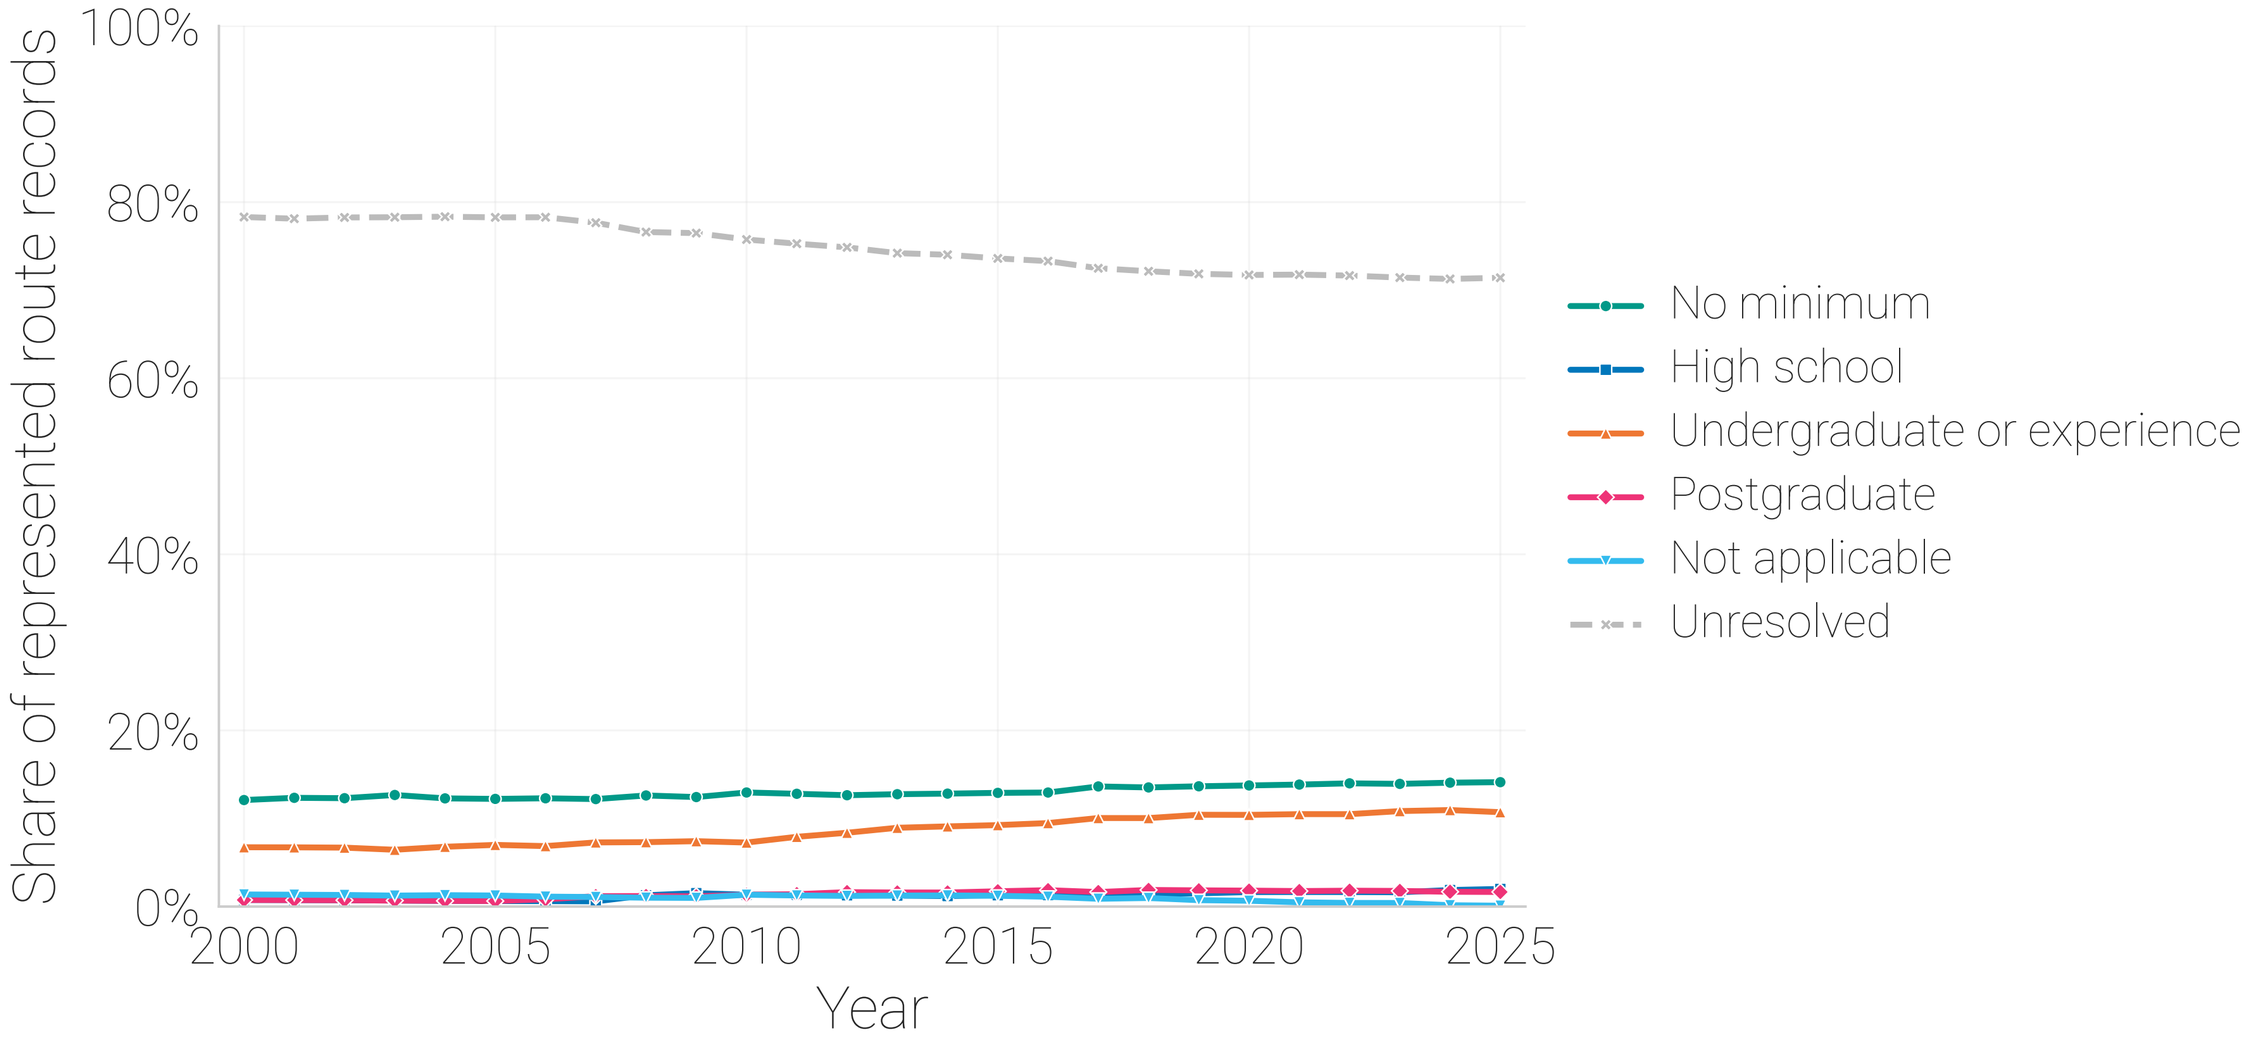

Recorded pass counts and unresolved evaluations are different objects

▶ Return: bridge ▶ Return: pooled profiles

Credential requirements are often unresolved

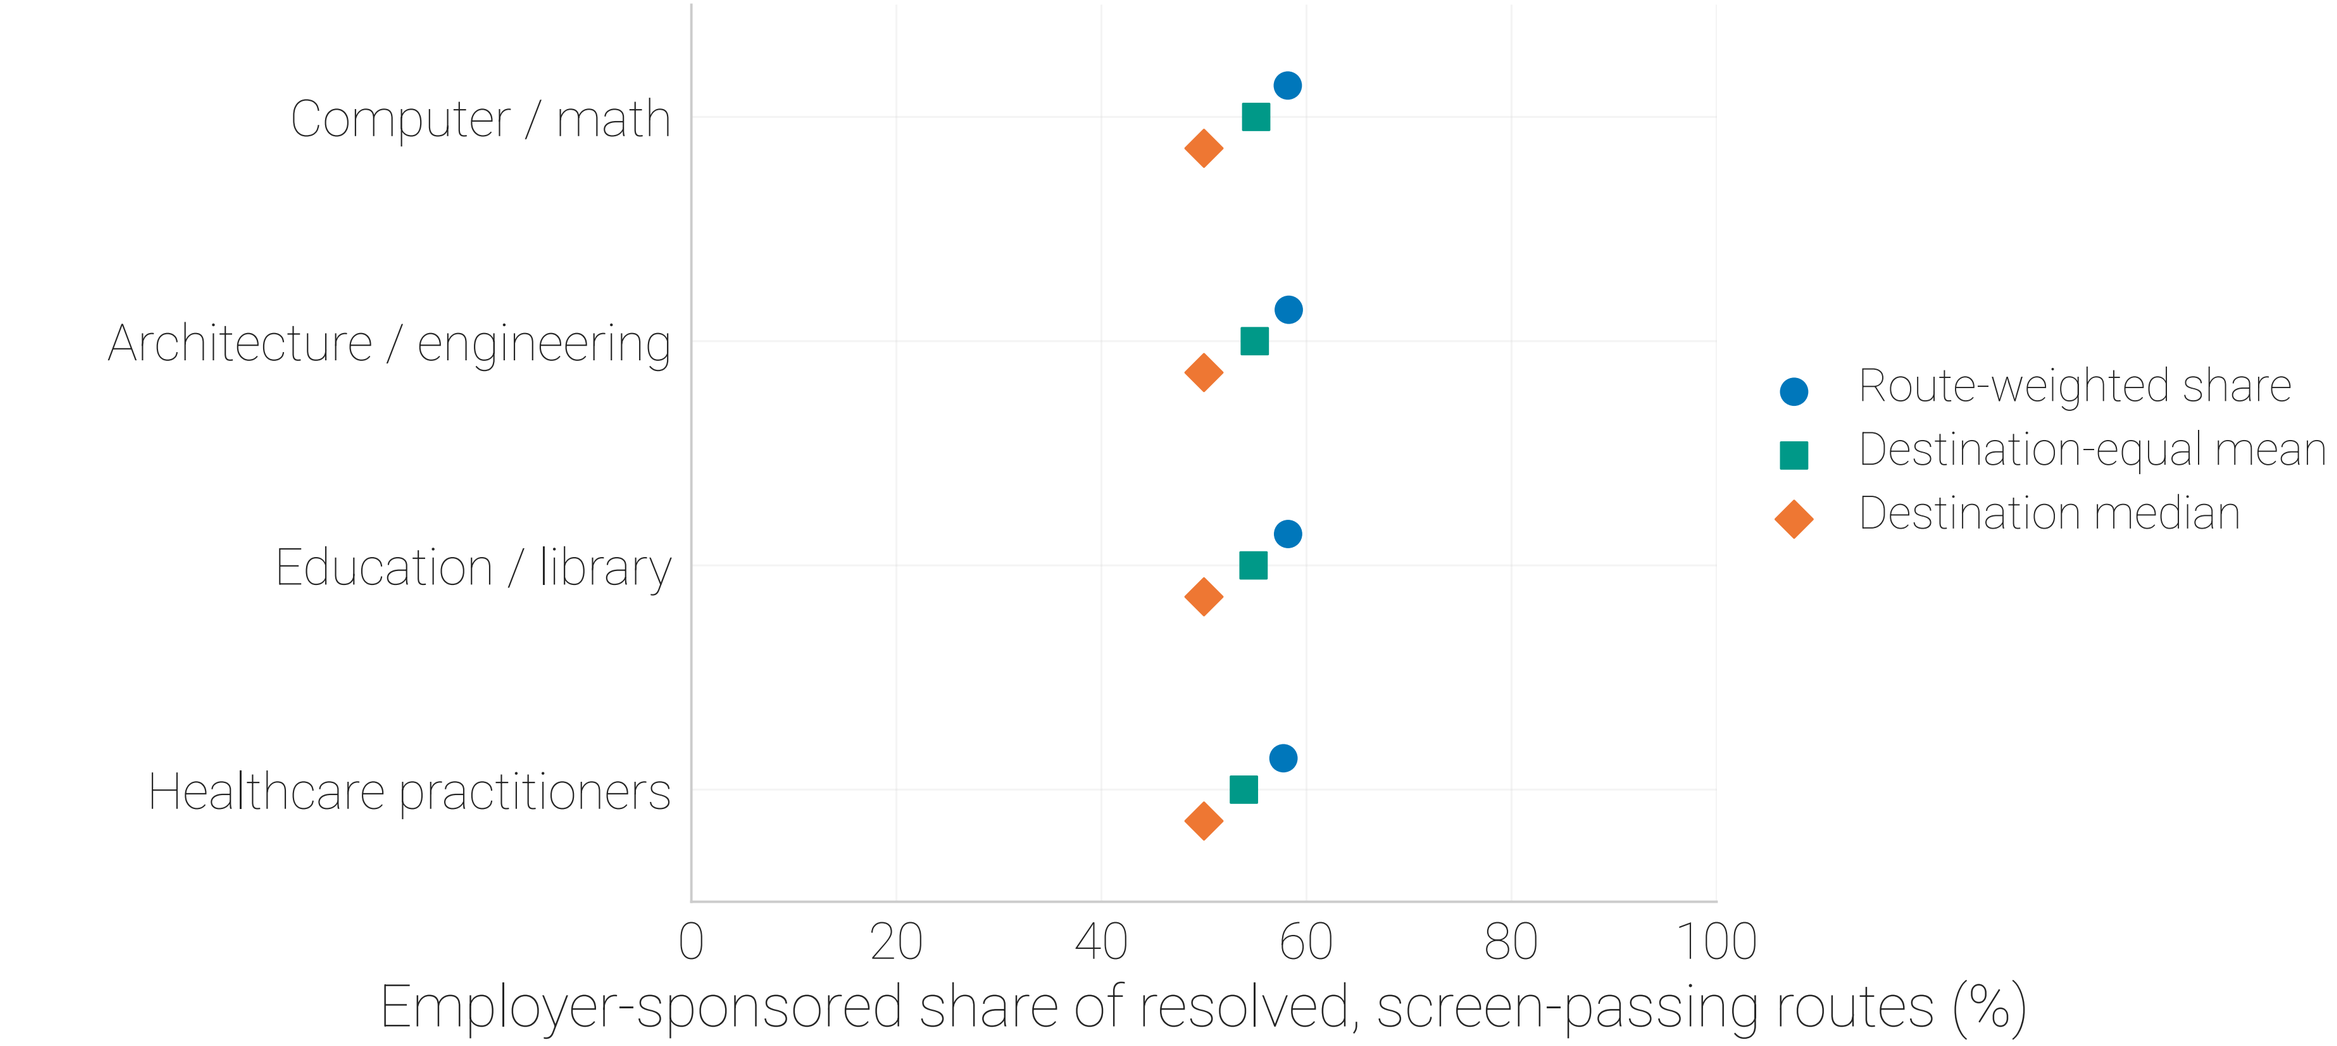

2000–2025 · represented route records · not an ordinal route-skill ranking

▶ Return: screening

Sponsorship shares depend on the weighting rule

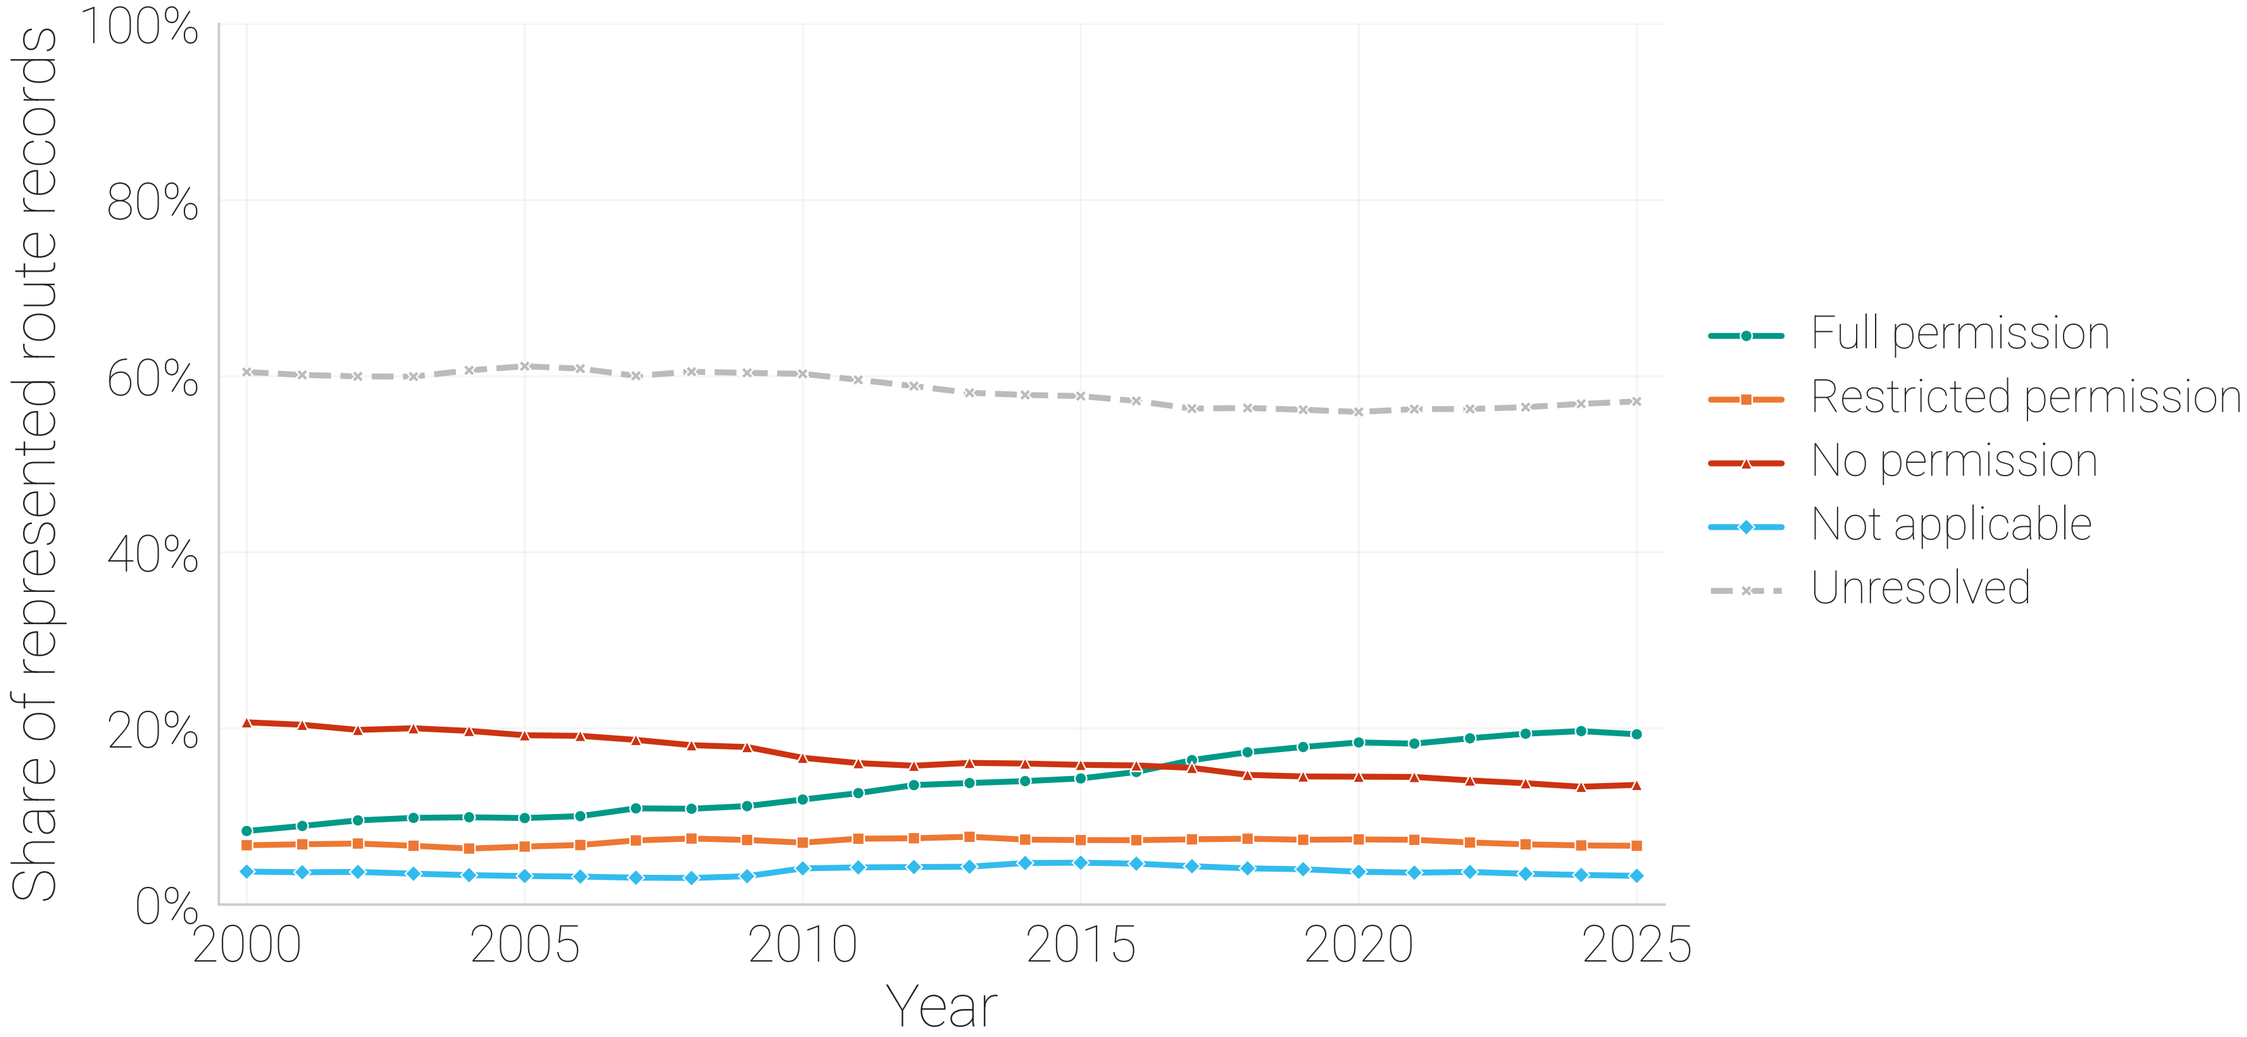

2024 · route-weighted, destination-equal and median comparisons

▶ Return: screening

Spouse work rights are one part of the route bundle

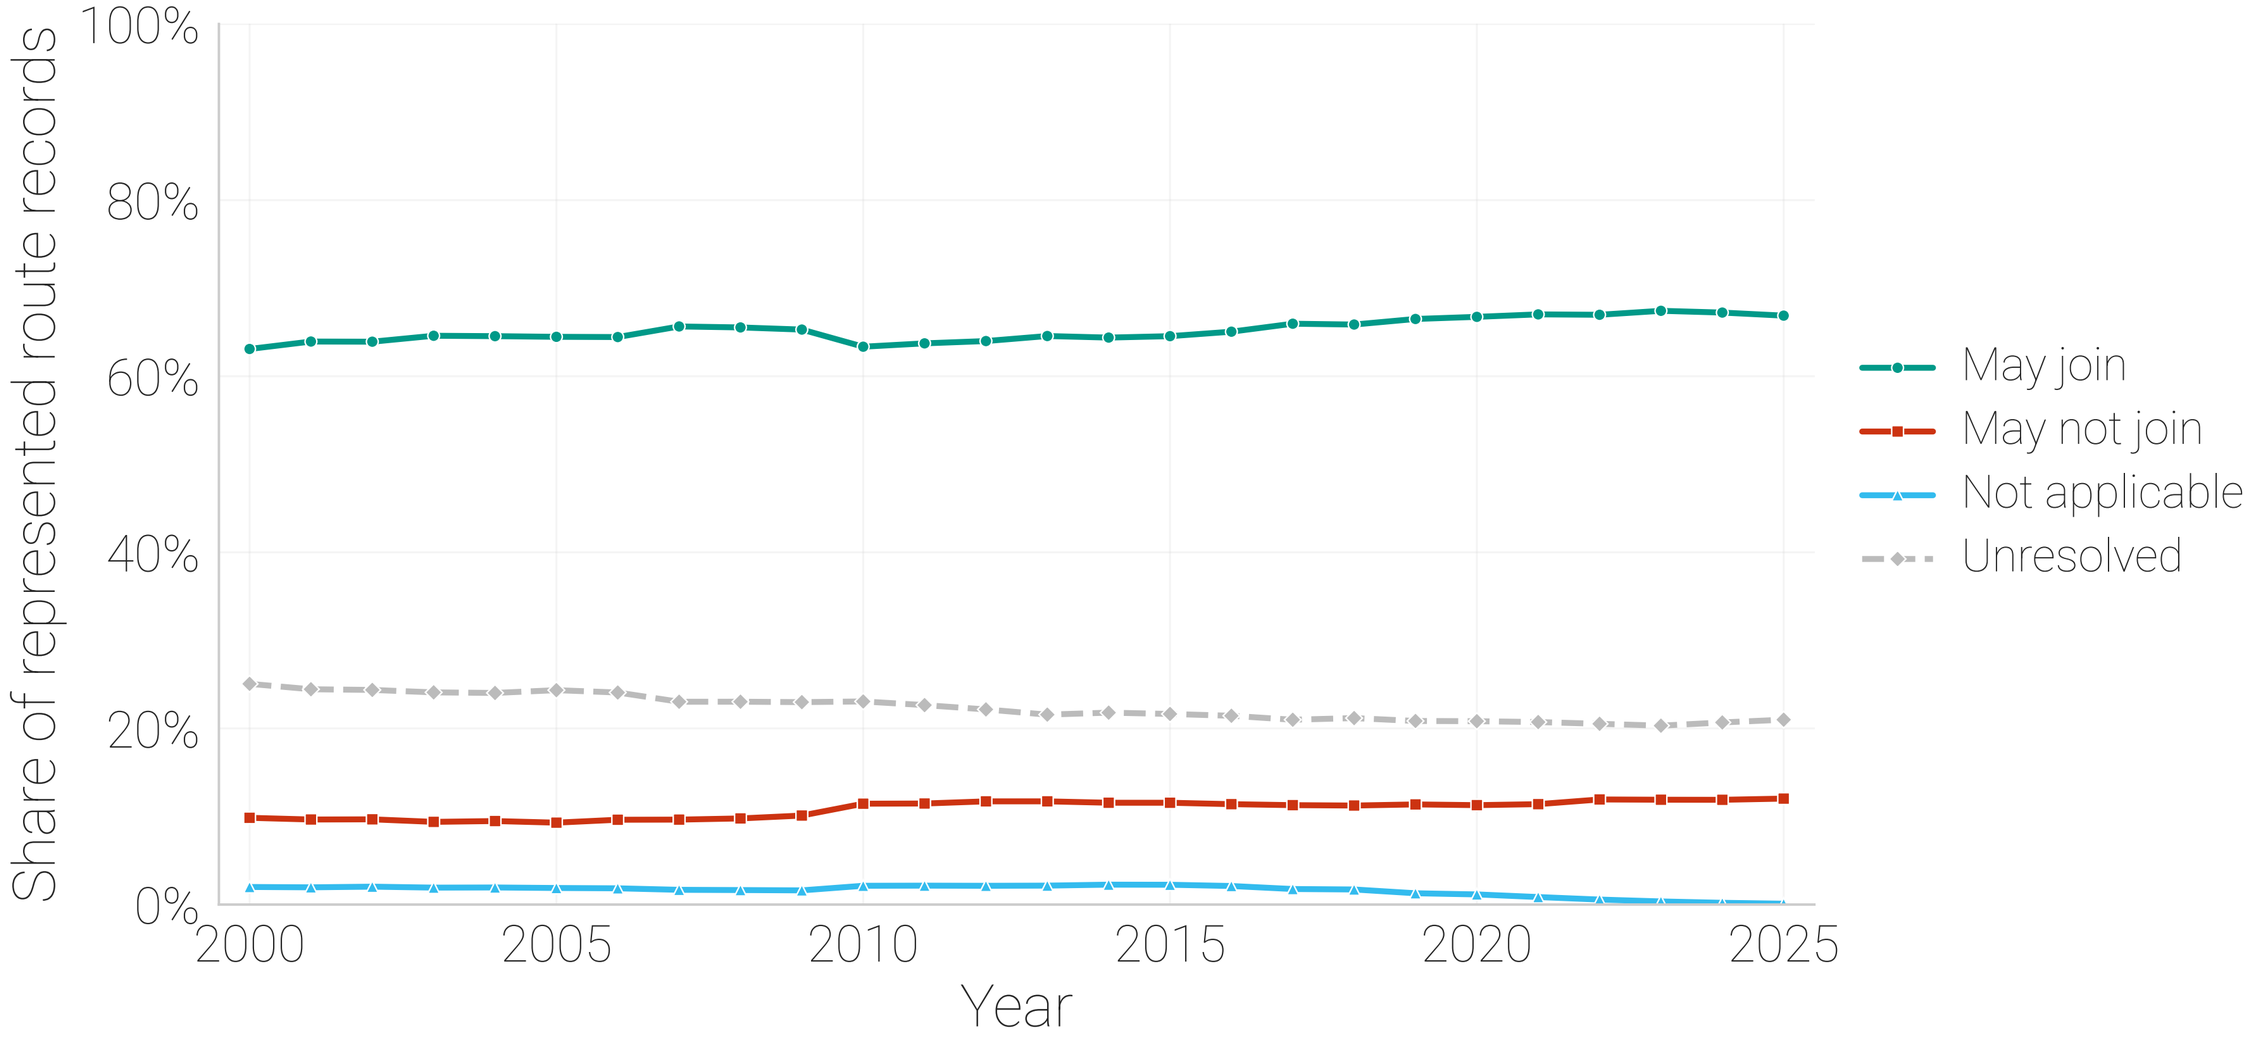

Represented route records · not an active-only or applicant-weighted denominator

▶ Dependent access ▶ Return: screening

Dependent access and dependent work rights are distinct

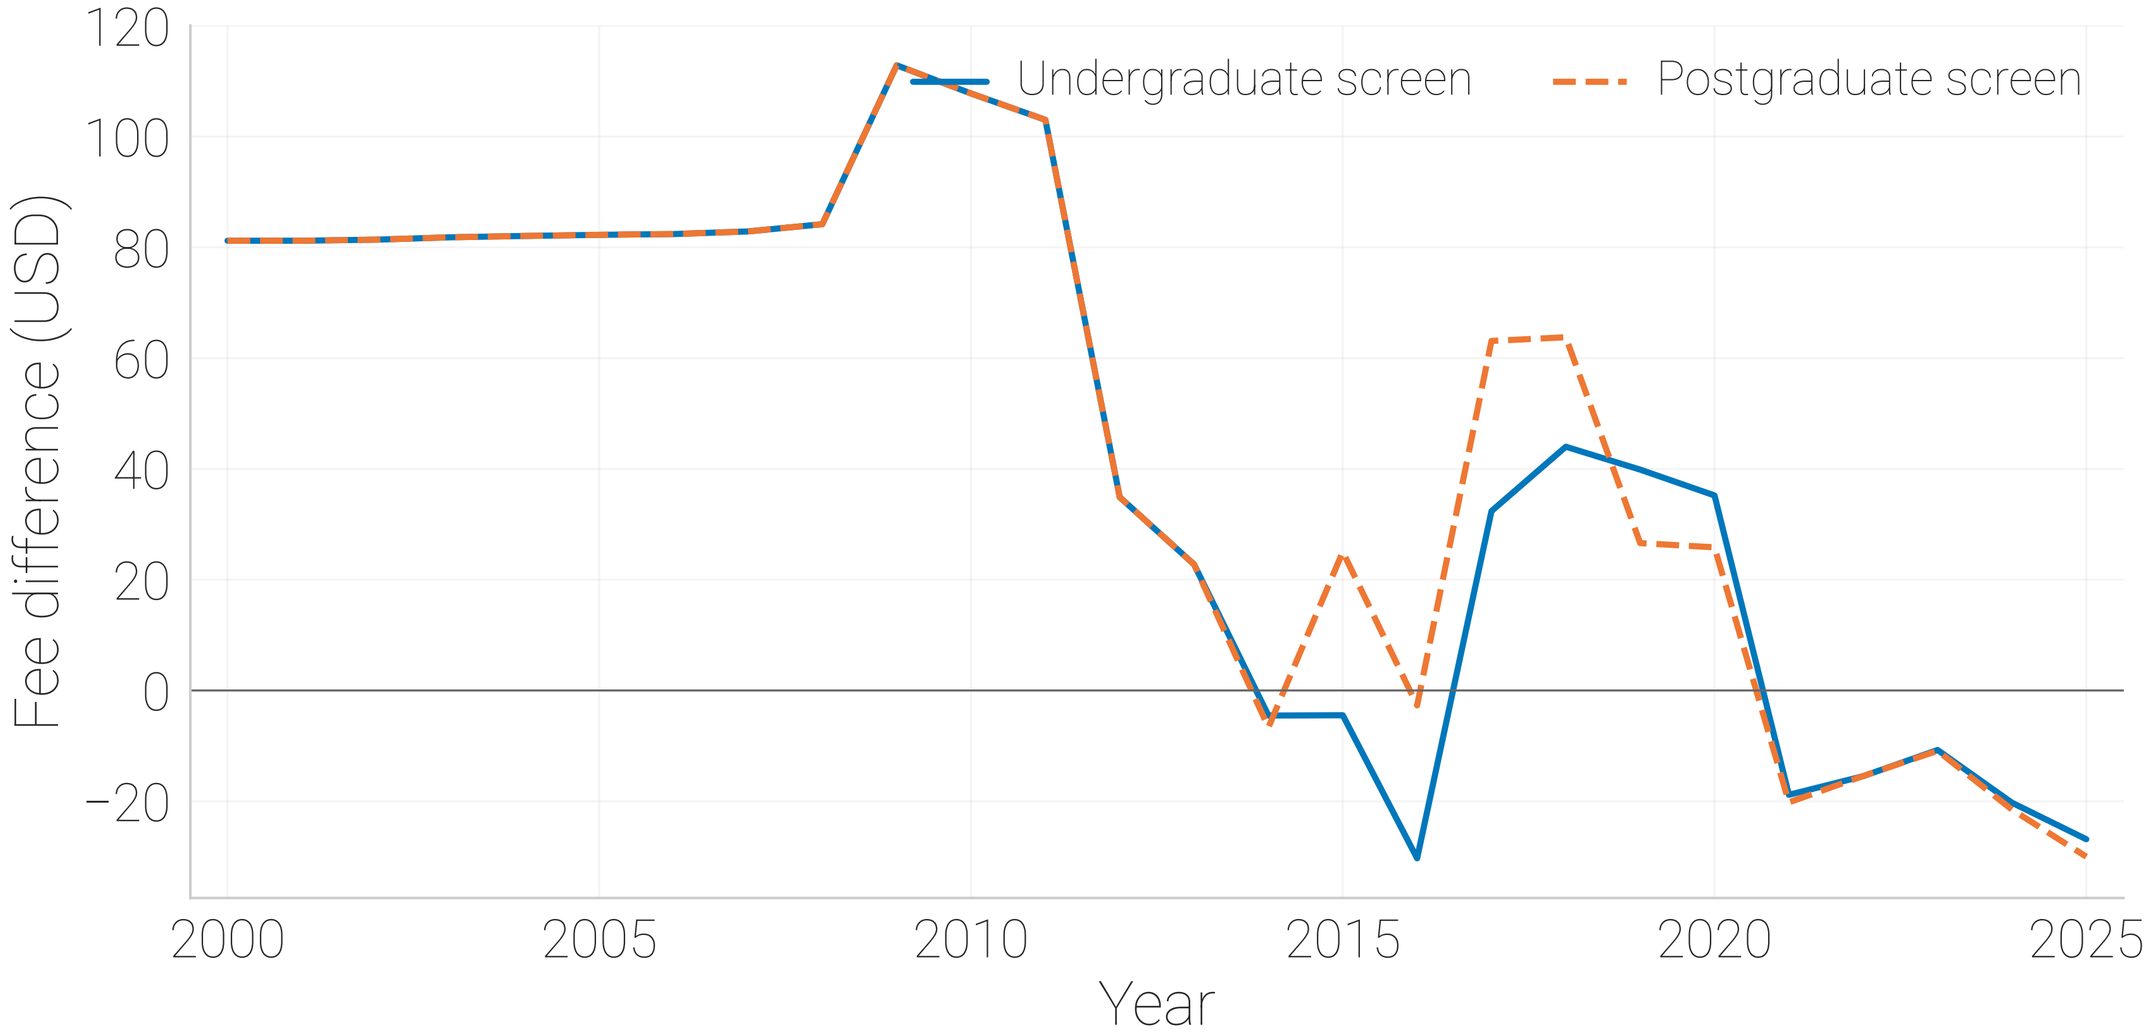

Represented route records · preserve unknown and inapplicable states

▶ Return: family-rights comparison
▶ Return: screening

Joint fee contrasts keep comparisons within a profile cell

SOC 15 · employer-sponsored minus explicit-none routes · comparable applicant fees

▶ Return: screening

Dominance needs complete, comparable bundles for one applicant

For declared dimensions, route A weakly dominates B only if A is weakly preferred on every dimension and strictly preferred on at least one.

- Fix citizenship, occupation, education, destination, year and application stage.
- Compare actual joint terms—not a synthetic combination of minima.
- Confirm the preference direction: a salary threshold is not a promised wage.
- Keep admission risk, sponsor availability, future rights and missing terms visible.

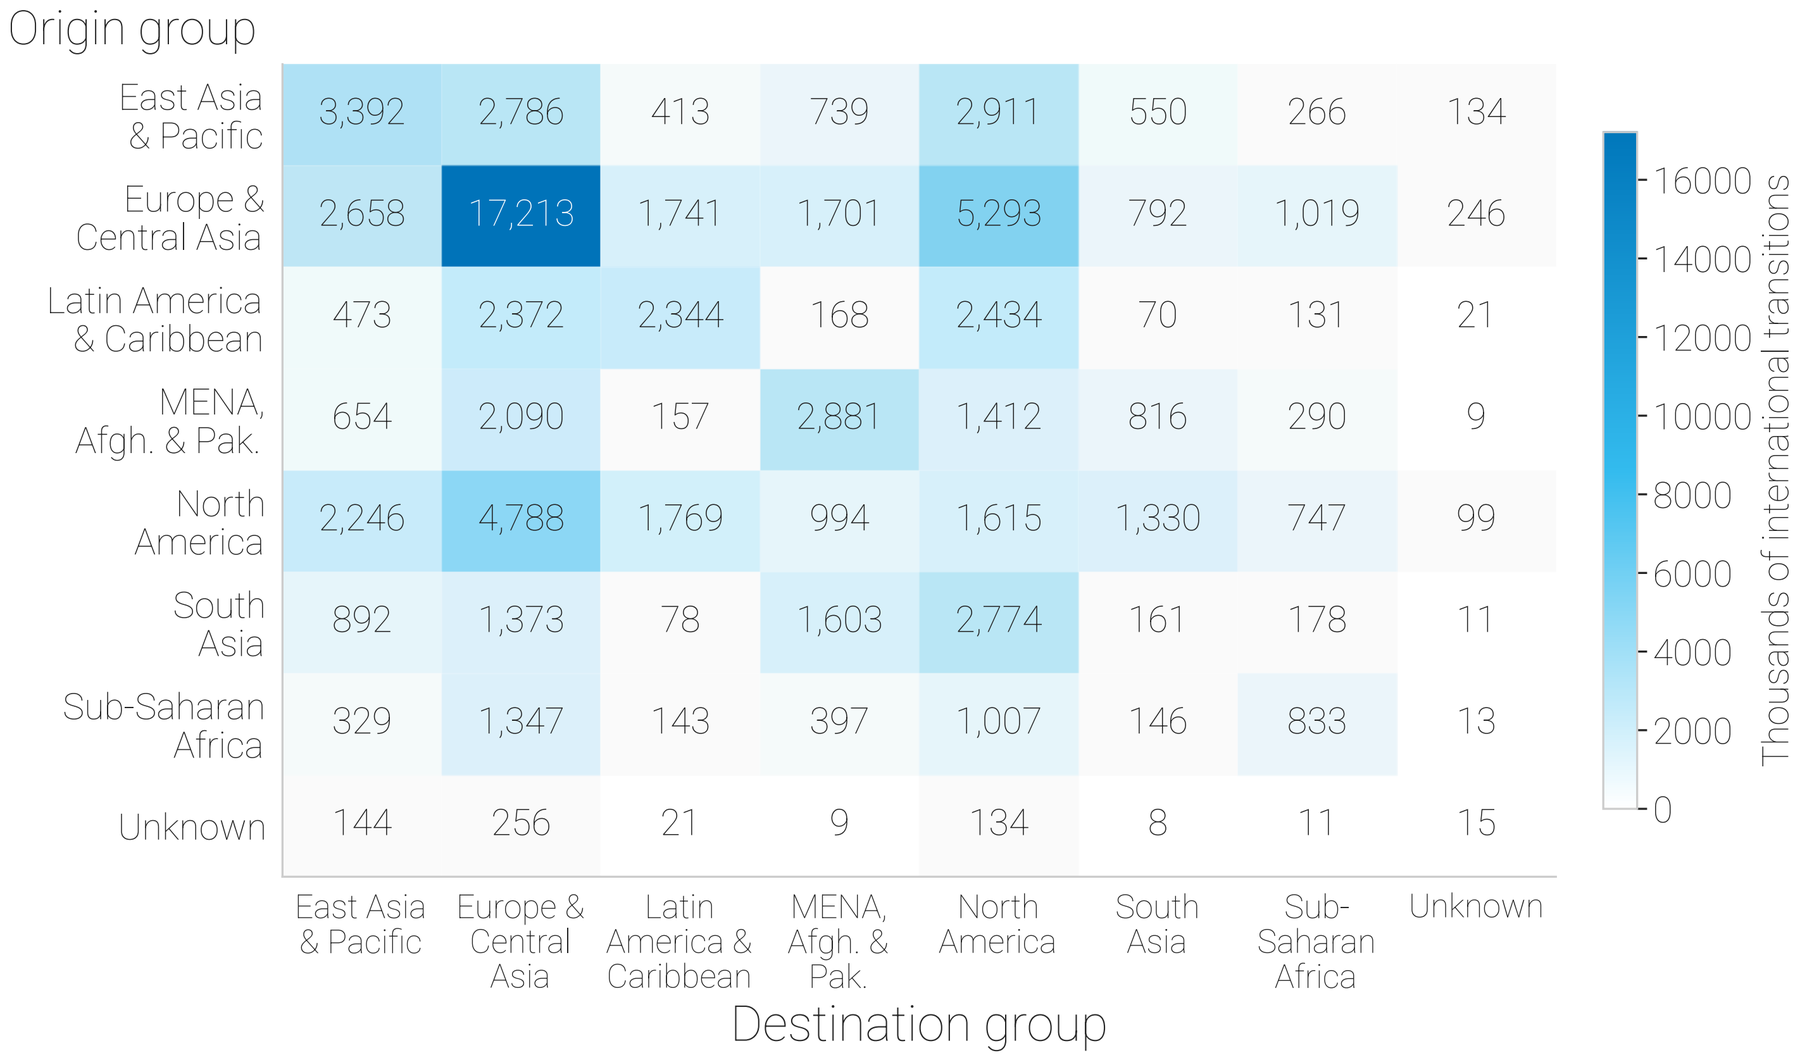

Report: dominated on observed dimensions; incomparable; or unassessable. Absence of observed dominance is not complete economic nondominance.

▶ Return: bundles

Appendix: group-to-group mobility

Region-to-region international transition volumes

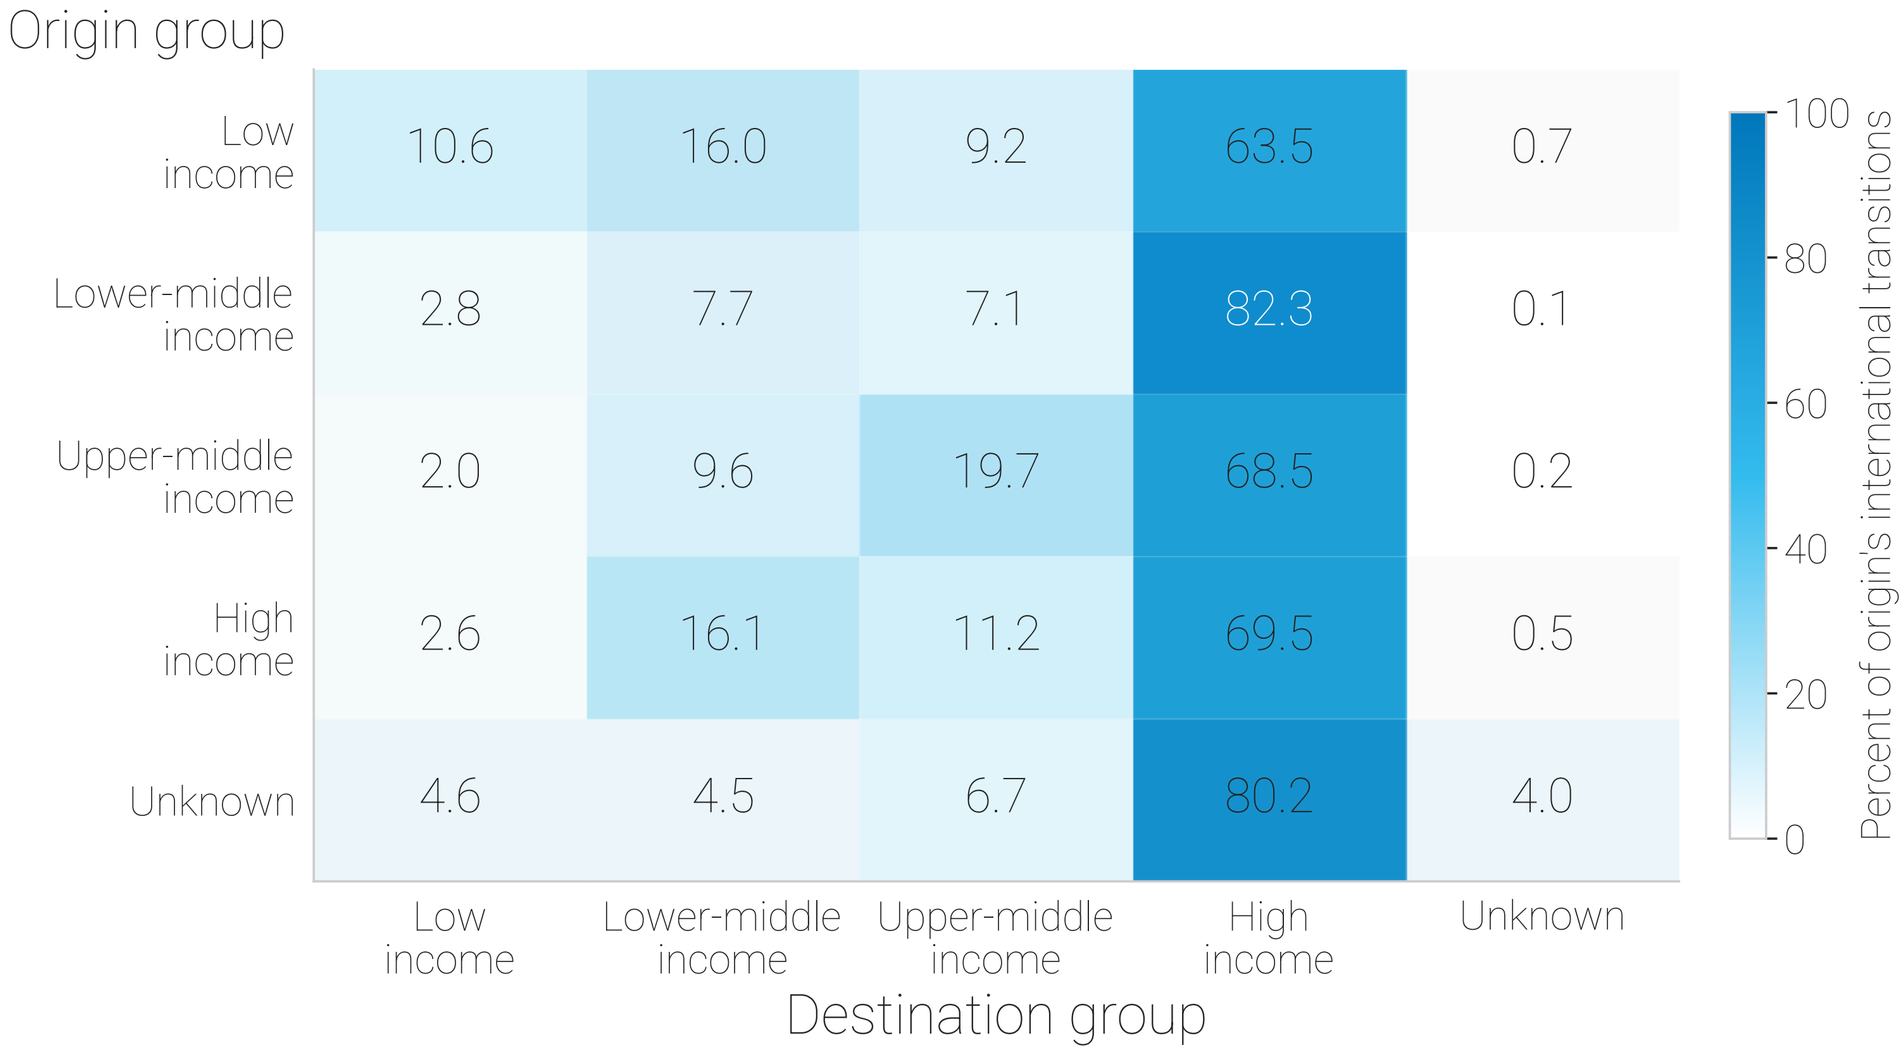

2010–2025 · fixed World Bank 2026 regions · repeated international events

▶ Return: origin-conditional shares

International transitions between income groups

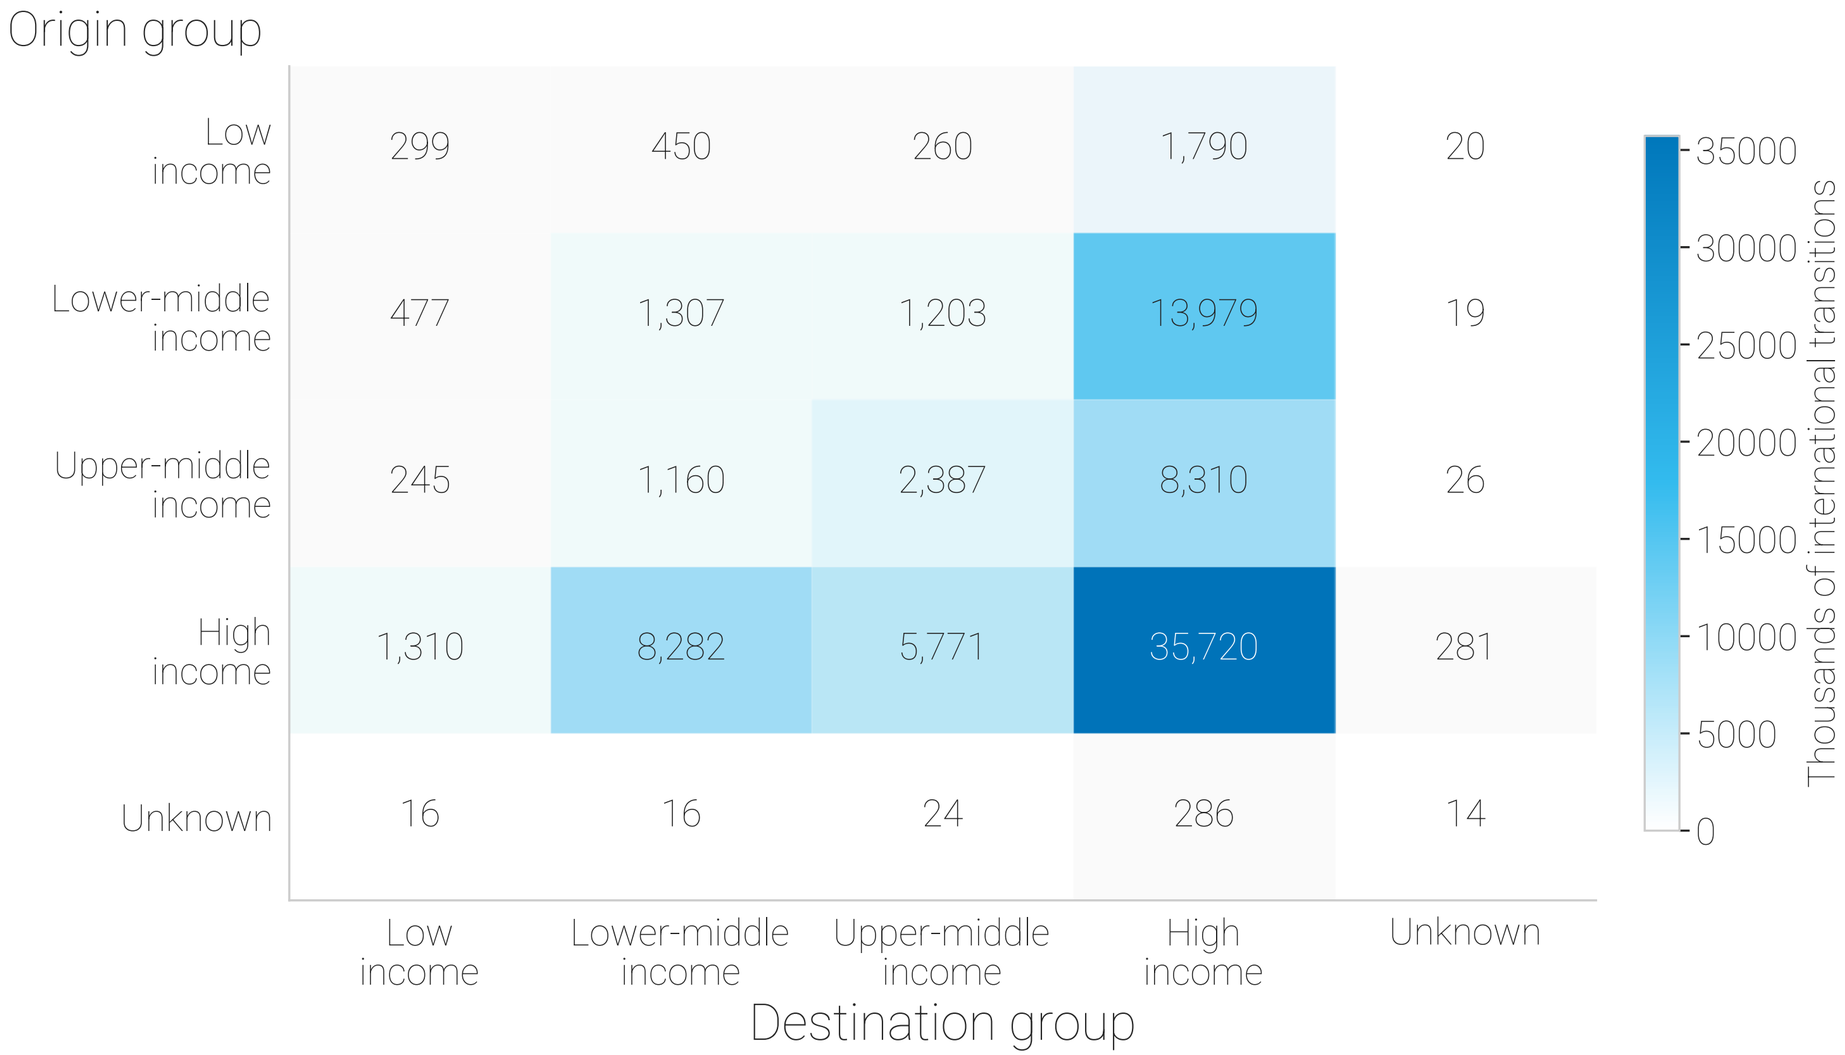

2010–2025 · fixed World Bank FY2011 income groups · origin-conditional shares

▶ Counts ▶ Return: regional transitions

Income-group transition volumes reflect origin size too

2010–2025 · fixed World Bank FY2011 groups · country income, not personal wages

▶ Income shares ▶ Return: regional transitions

Origin-to-destination occupation volumes

Recognised SOC major groups · international events · no ordinal skill interpretation

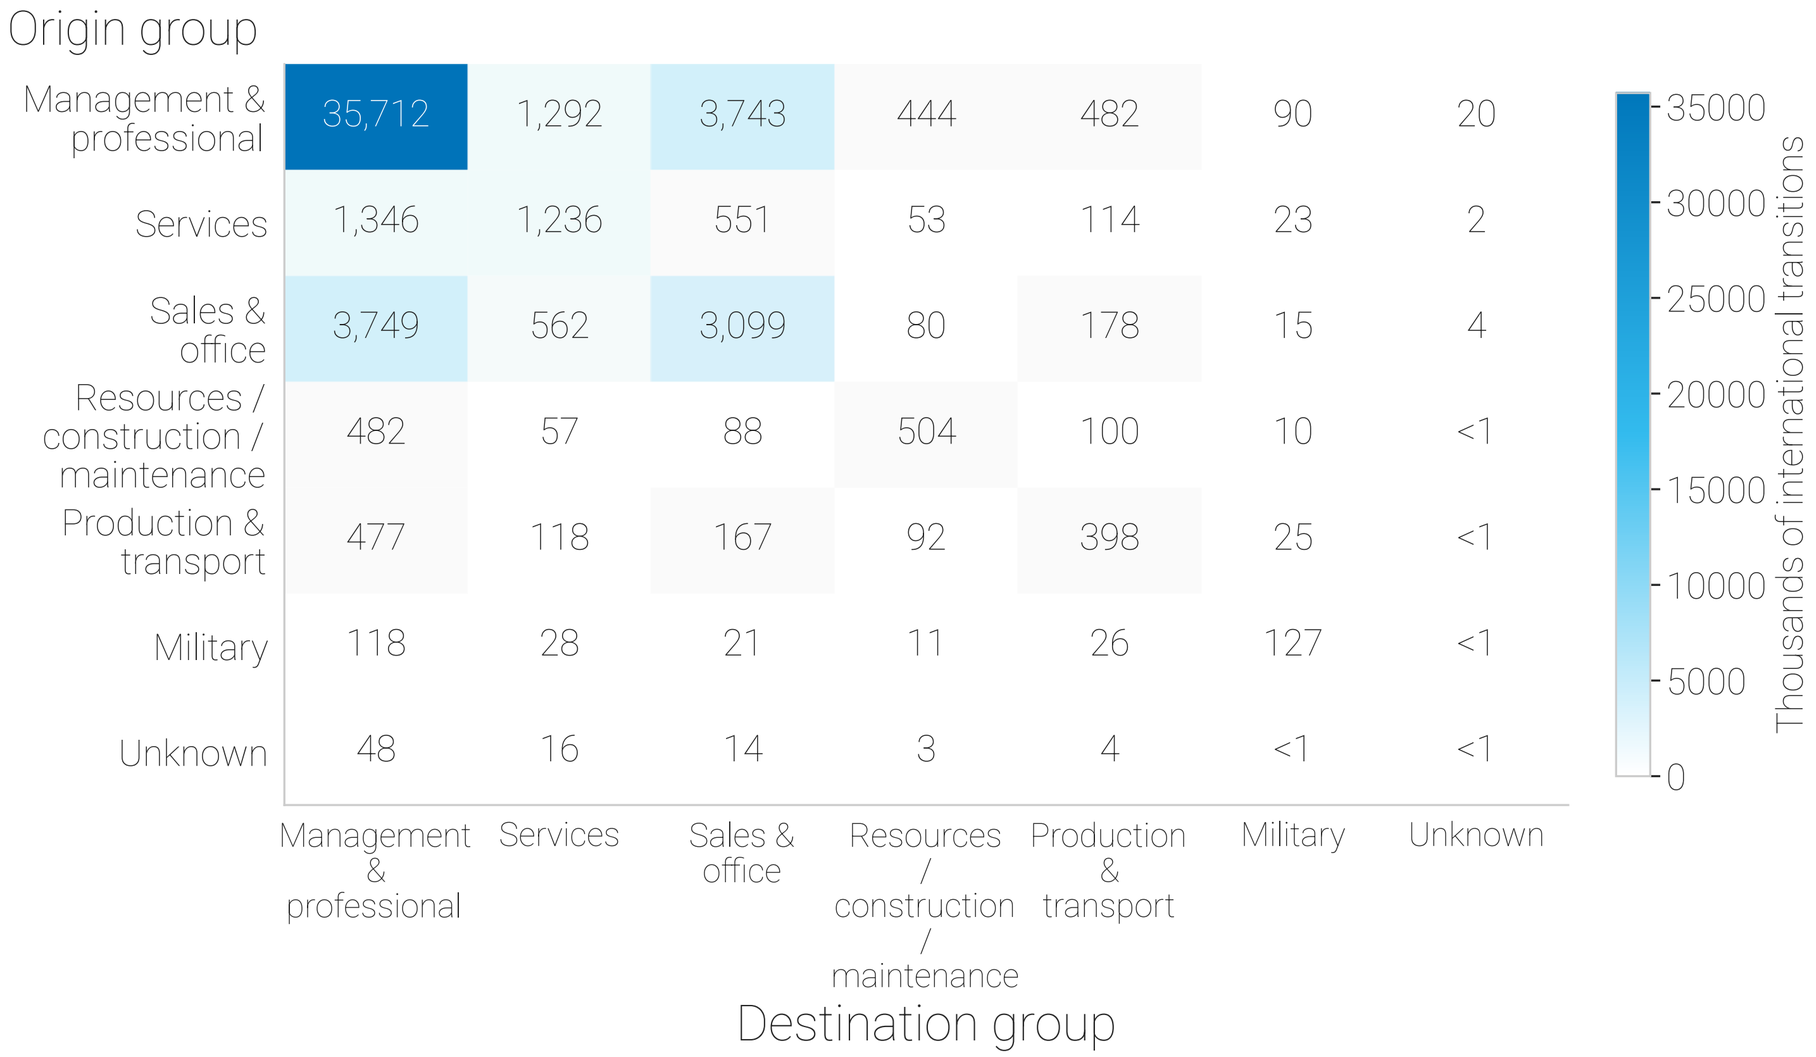

▶ Detailed occupation shares

▶ Return: occupational families

Broad occupational-family transition volumes

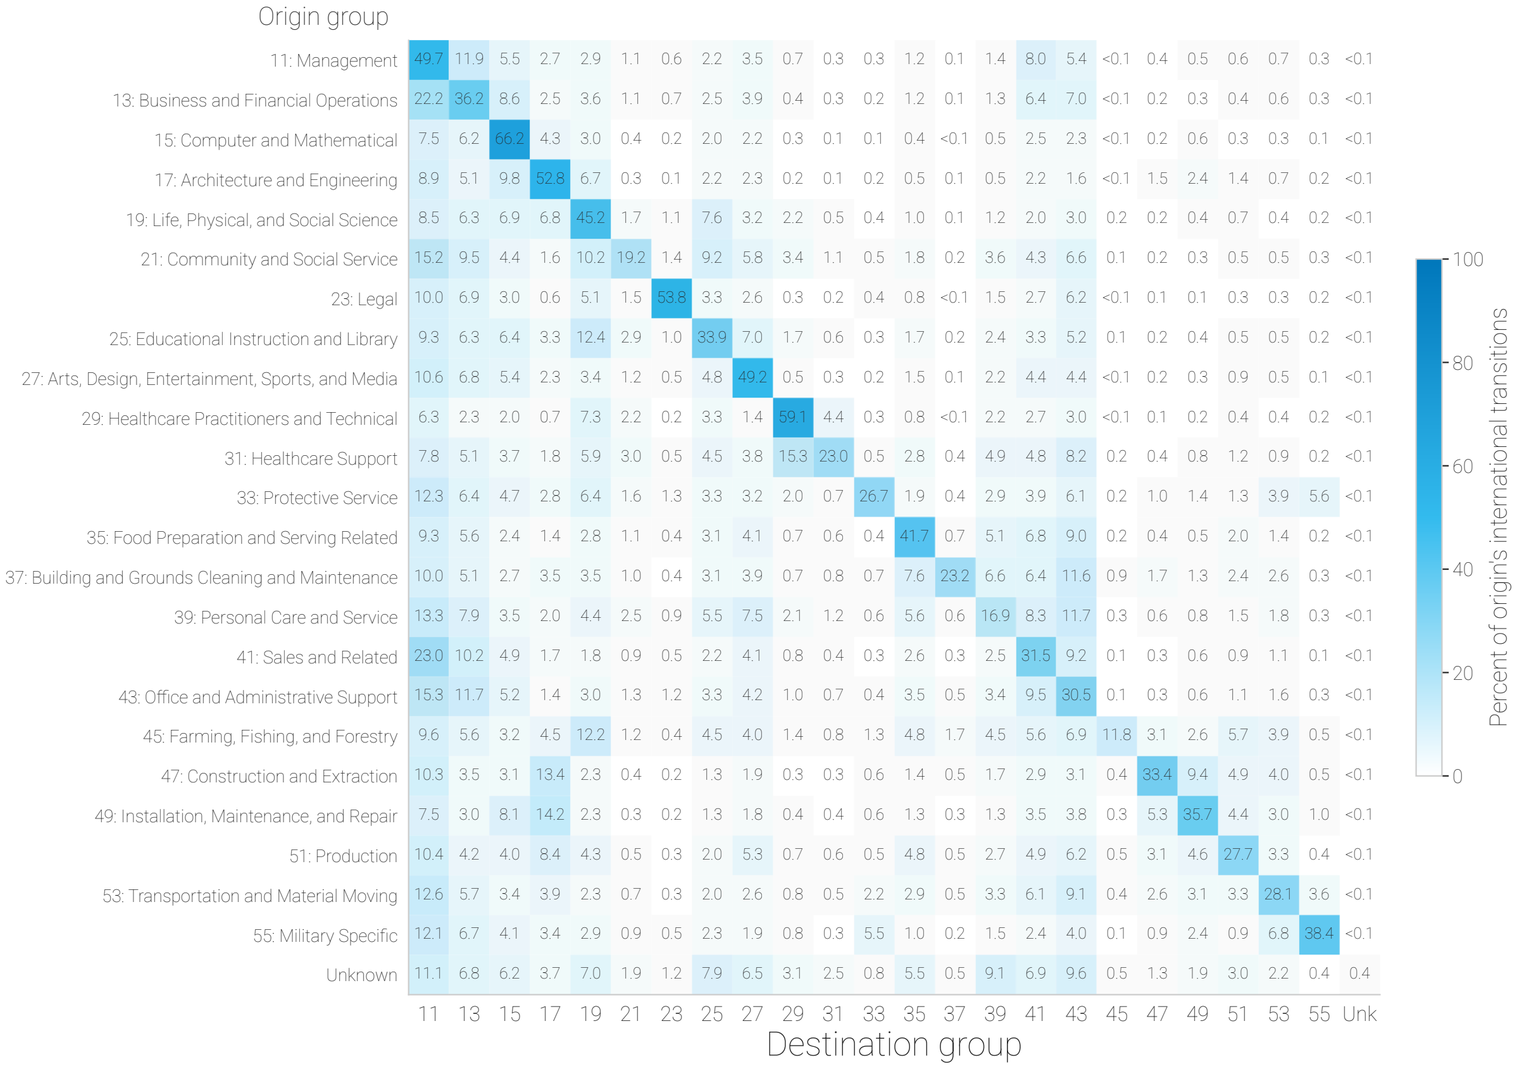

Six analytical families plus unknown · repeated international events

▶ Return: family shares ▶ Detailed SOC counts

The full matrix retains every SOC major group

23 groups plus unknown · origin-conditional shares · detail for discussion and zoom

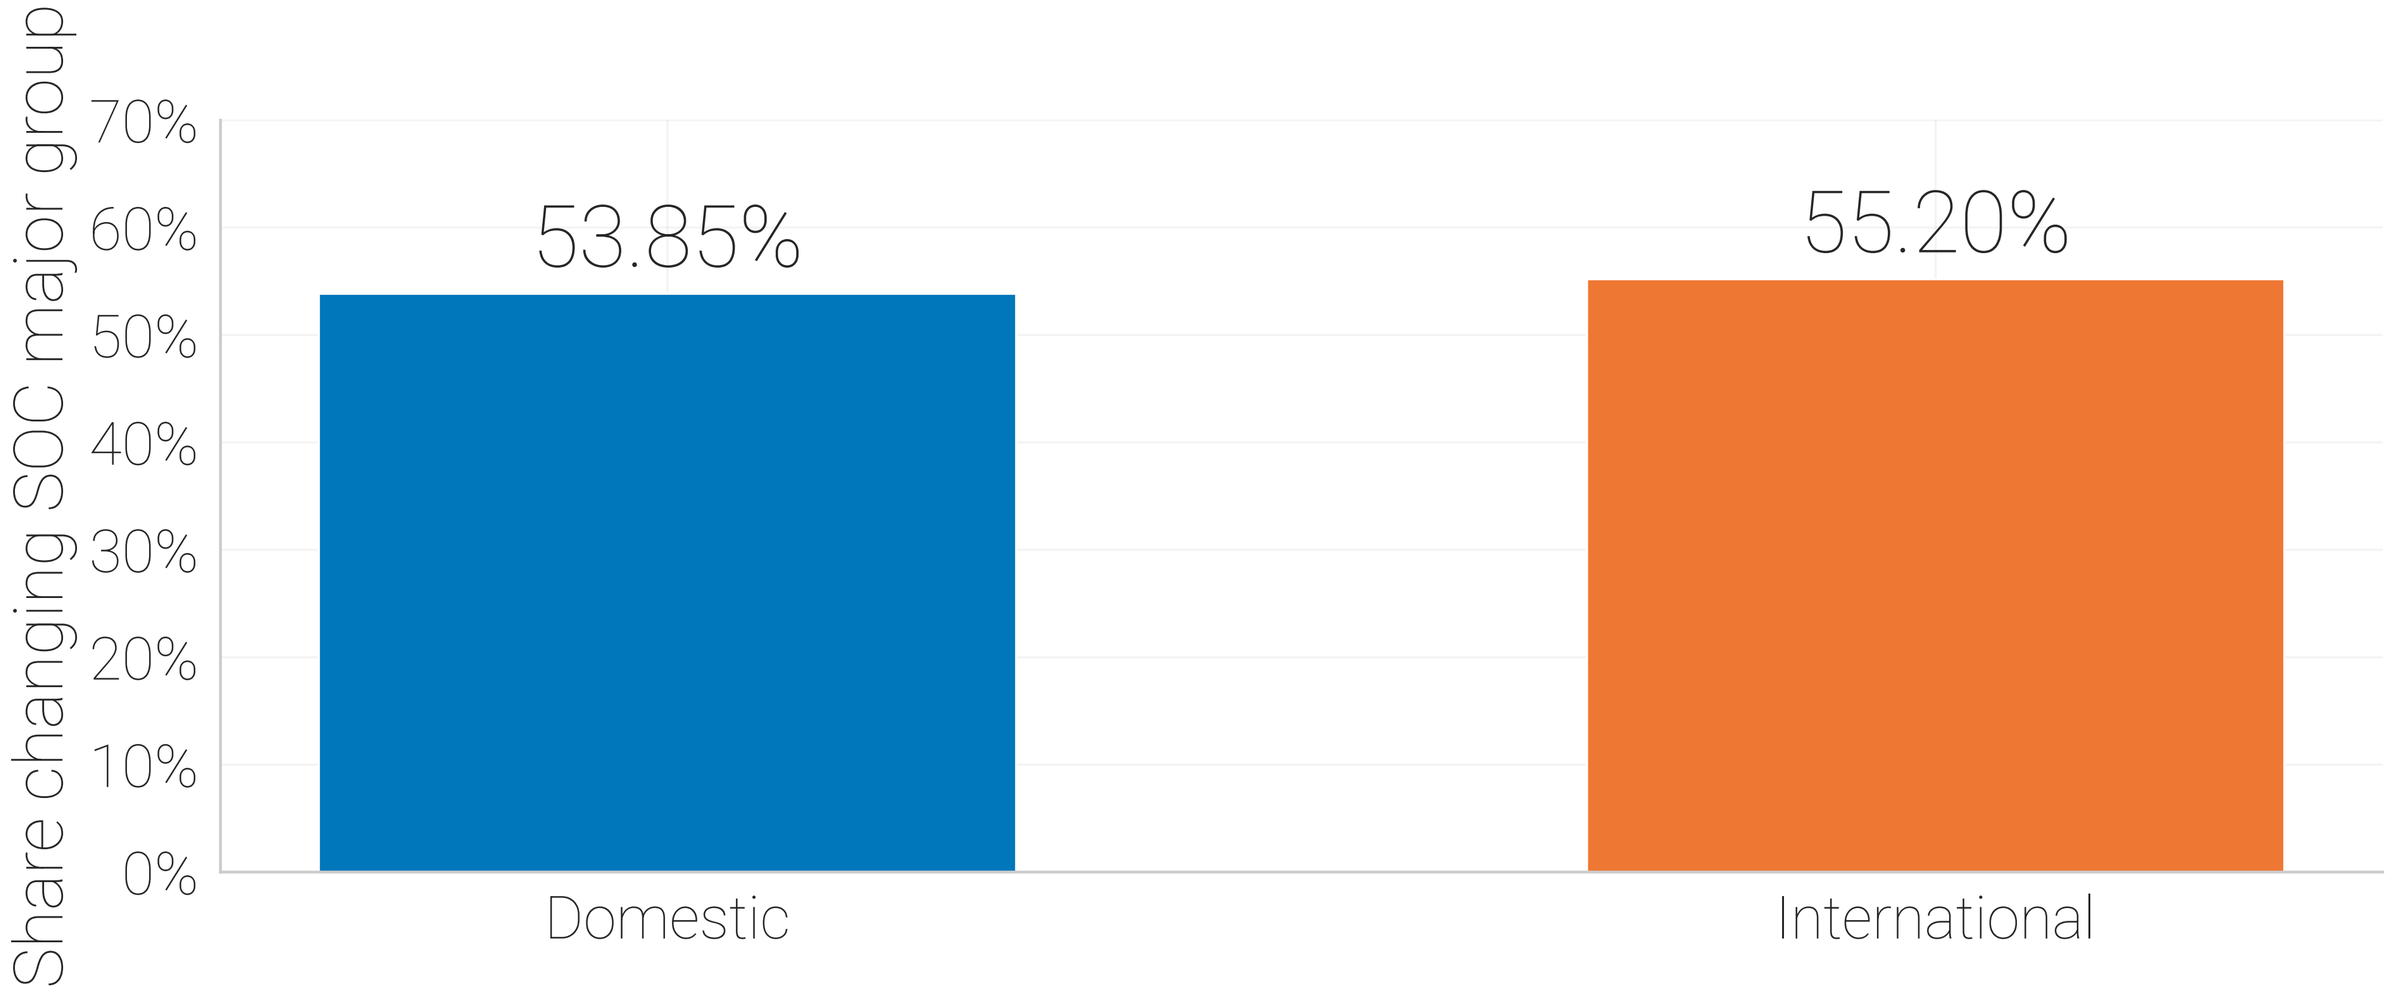

▶ Detailed counts

▶ Return: occupational families

Switching occurs in domestic and international job transitions

2010–2025 · recognised full occupation codes · event-weighted

▶ Return: occupational transitions

Occupational groups are not a skill ladder

- SOC major groups describe kinds of work; their numeric codes are not ranks.
- The broad SOC-to-ISCO reference scenario permits upward, downward and equal changes for about **95%** of events.
- Routine/non-routine, cognitive/manual and preparation requirements are distinct concepts.
- A defensible skill-transition matrix needs a verified finer code/vintage and a declared crosswalk; it cannot be recovered from destination skill marginals.

The occupation matrix is descriptive evidence. A ranked skill matrix is not yet established.

▶ Return: occupational transitions ▶ Taxonomy

Appendix: estimation and literature

MPML normalises the supplied alternatives, not a missing population

$$\mu_{ra} = \exp(\alpha_r + \beta x_{ra} + z'_{ra}\gamma), \quad p_{ra} = \frac{\exp(\beta x_{ra} + z'_{ra}\gamma)}{\sum_{b \in A_r} \exp(\beta x_{rb} + z'_{rb}\gamma)}.$$

$$\ell(\beta, \gamma) = \sum_{r,a} Y_{ra} \log p_{ra}.$$

- Profiling the row effect gives the corresponding Poisson objective on **identical support and weights**.
- Current A_r contains observed positive, policy-matched international cells.
- Fitting supplied row totals does not recover unobserved stayers or unavailable destinations.

Fixed effects determine the monetary comparison

Specification	Conditional row	Additional fixed effects
L	Origin × year	Destination; occupation × education × year; dyad
D	Origin × year	Destination × year; occupation × education × year; dyad
T	Origin × occupation × education × year	Destination × year; dyad × occupation
K/E	Type-specific origins	Destination × occupation(× education) × year; dyad × occupation

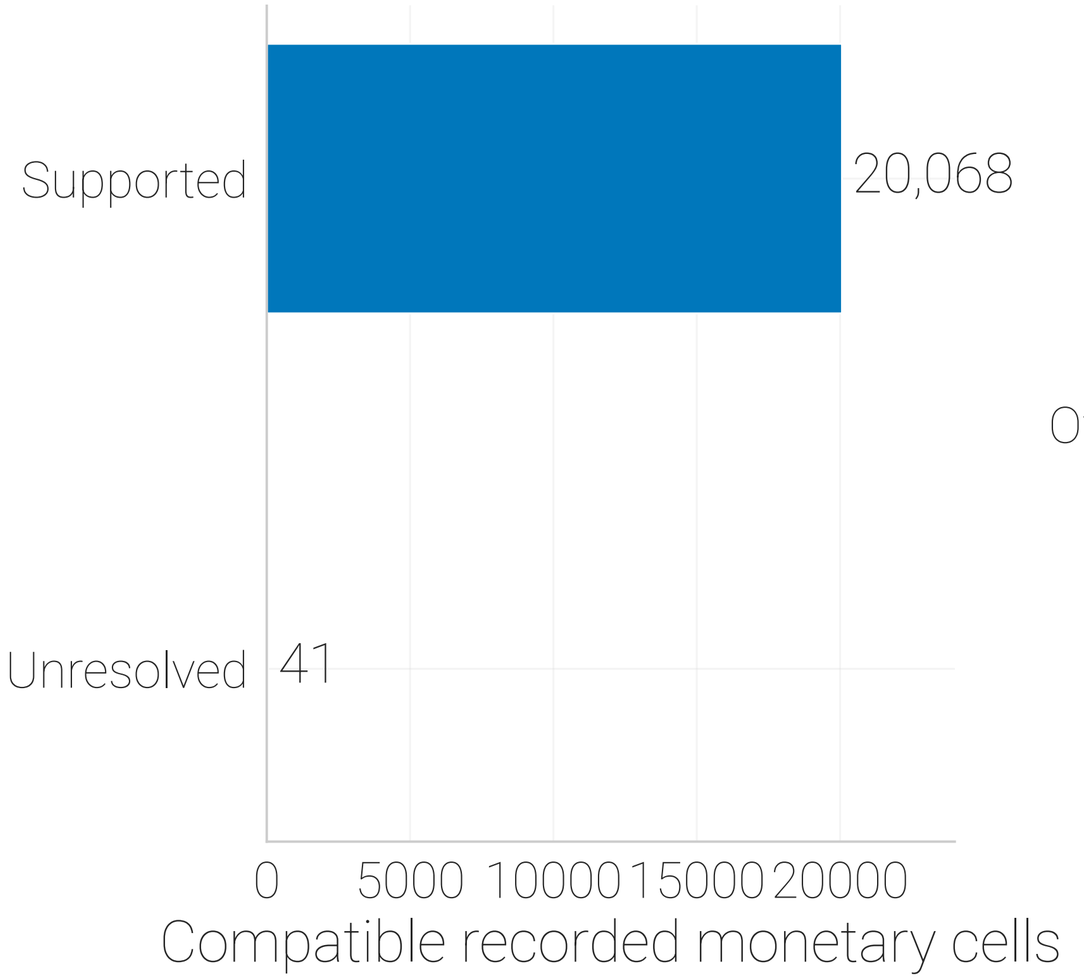

K/E absorb the monetary policy variation: **not identified**, not an estimated zero effect.

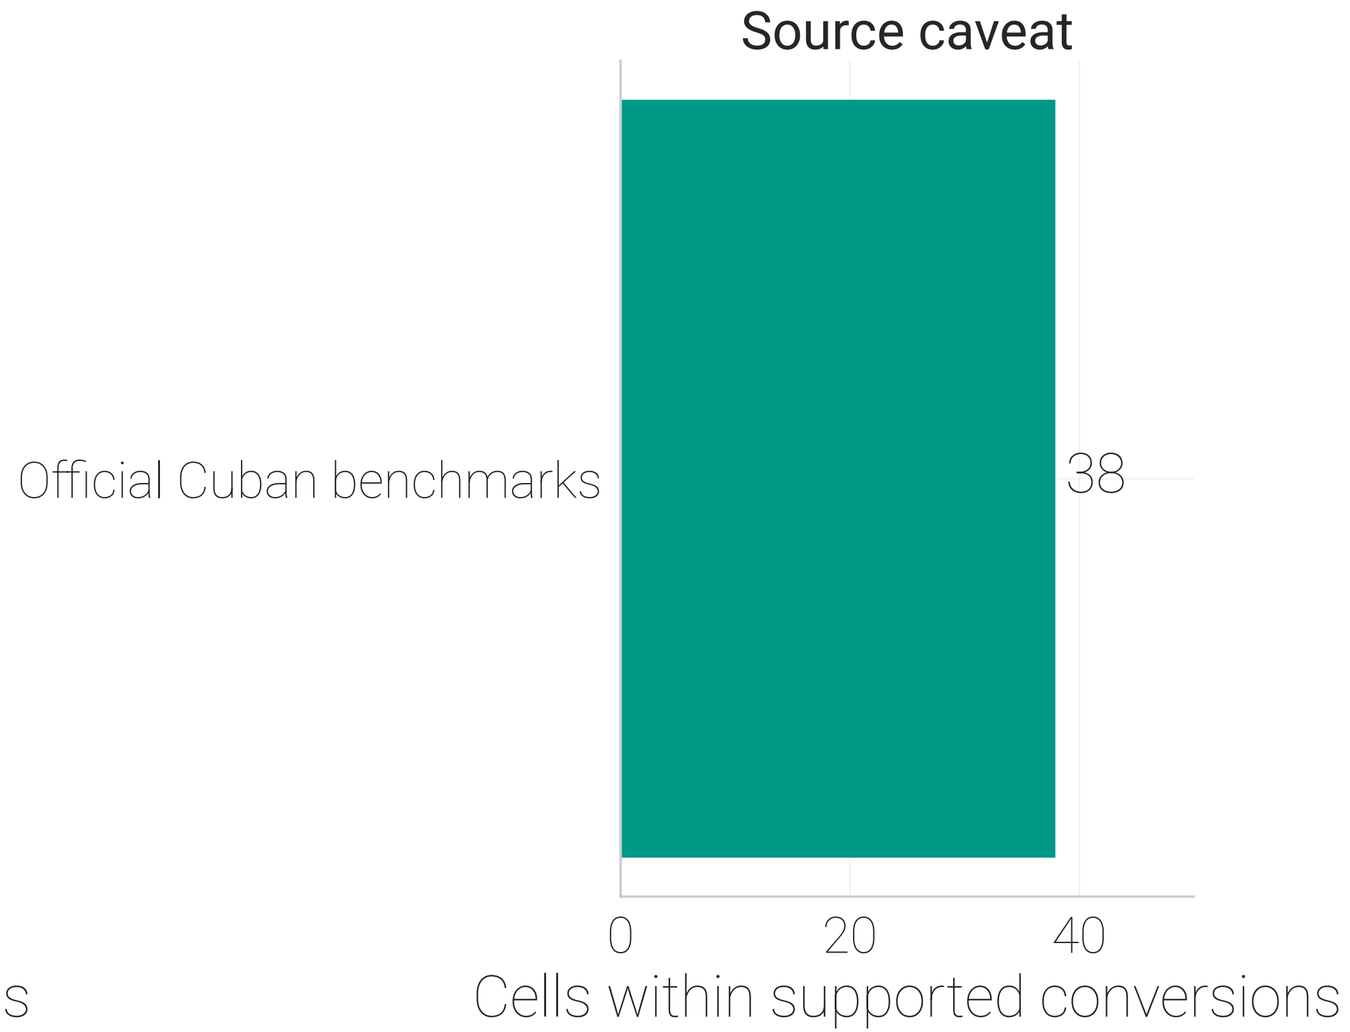

The estimand and fixed effects must leave the relevant policy variation. Dyad effects absorb fixed distance; destination-time effects absorb destination-wide offers. Neither automatically resolves individual access restrictions.

▶ Return: worker responses ▶ Return: monetary preliminaries

Monetary comparisons need compatible amounts and units

FX support is not proof of fee definition, real value or incidence

▶ Return: monetary preliminaries

Rich histories do not by themselves separate preferences from access

(Berry and Haile 2024; Agarwal and Somaini 2026)

- Legal compatibility, consideration, sponsorship, admission and take-up are distinct stages.
- Observed characteristics and repeated choices add information; they do not eliminate market-level unobservables or supply excluded variation automatically.
- Applications, refusals, route-linked admissions and usable offers can help distinguish these stages.

Our task: define the choice occasion, population, support and policy variation before treating conditional allocation slopes as migrant elasticities.

▶ Return: contribution ▶ Return: worker responses

Fee competition identifies a net marginal object

$$G_d = f_d' n_d(f) + B_d(n_d) - C_d(n_d), \qquad c_d - b_d = f_d + (D_d^{\mathsf{T}})^{-1} n_d.$$

D_d is the own-route quantity-by-fee derivative matrix; b_d and c_d are marginal benefits and resource costs.

- Requires identified unilateral fee responses, matching fee/quantity units, interior optimality and no omitted binding constraint.
- Capacity adds a multiplier; application fees need application-stage revenue.
- Adding the same function to B_d and C_d leaves choices unchanged: unrestricted benefits and costs are **not separately identified**.

Trade-policy inversion provides a comparison, not a Visa identification theorem (Adão et al. 2025).

▶ Return: cost preliminaries ▶ Return: next steps

Welfare needs a population and an adjustment mechanism

- Migrants and families; origin residents; destination residents; employers; governments.
- Wages, amenities, fiscal effects and housing or other prices may adjust.
- Fees are transfers, waiting uses time, and restrictions can remove future options.
- Government recruitment gains do not establish gains for everyone affected.

Counterfactual scope: worker responses at fixed offers → market adjustment → government responses, adding assumptions at each step.

▶ Return: next steps

Policy measurement and allocation frame the contribution

Previous findings and the contribution to each literature

- **Policy measurement:** levels, signed changes and instrument indicators have different units (Helbling et al. 2017; de Haas et al. 2018; Czaika and Parsons 2017).
  → **Our contribution:** dated route bundles and comparable occupation–education profiles.
- **Alternative destinations:** multilateral resistance and third-country diversion already have direct treatments (Bertoli and Fernández-Huertas Moraga 2013; Brinatti and Guo 2024).
  → **Our contribution:** connect changing legal menus to domestic and international careers.
- **Careers and equilibrium:** dynamic location choice; employer options and wage setting; connected domestic markets (Kennan and Walker 2011; Townsend and Allan 2025; Borusyak et al. 2026).
  → **Our contribution:** cross-country legal-menu measurement, with government and employer responses as proposed extensions.
- **Identification and policy:** constrained demand and revealed policy objectives require setting-specific restrictions (Berry and Haile 2024; Agarwal and Somaini 2026; Adão et al. 2025).
  → **Proposed extension:** identify worker substitution before recovering government incentives under explicit restrictions.

▶ Return: contribution ▶ References

Career histories have close empirical precedents

Professional trajectories, place values and policy-induced location choices

- **Return and onward careers:** professional histories trace return migration and foreign experience (Amanzadeh et al. 2024).
  - → **Our contribution:** connect those trajectories to dated legal-route measurement, not claim the first use of onward histories.
- **Place and human capital:** employment histories reveal conditional place premia and allocation patterns (Bhalothia et al. 2025).
  - → **Our contribution:** measure the legal offers and constraints facing comparable profiles.
- **Policy and founding location:** a start-up visa changes entrepreneurs' location choices (Lee and Glennon 2023).
  - → **Our contribution:** a broader route/history mapping rather than one programme or corridor.

▶ Return: contribution ▶ Demand framework

Screening and causal gravity inform different steps

Mechanism recovery, information timing and policy-effect identification

- **Inverse screening:** allocations, transfers and outside-option restrictions can identify types and costs (Aryal and Zincenko 2024).
  - → **Proposed use:** specify what visa choices must reveal before interpreting an inferred government cost.
- **Sequential screening:** information timing and regularity shape multidimensional menus (Gao 2026).
  - → **Proposed use:** formalise which worker attributes and signals are known when a route is offered or chosen.
- **Causal gravity:** staggered policy effects require comparison and aggregation assumptions (Nagengast and Yotov 2025).
  - → **Proposed use:** distinguish policy-effect identification from structural demand or government-objective recovery.

▶ Return: estimation ▶ Government incentives
